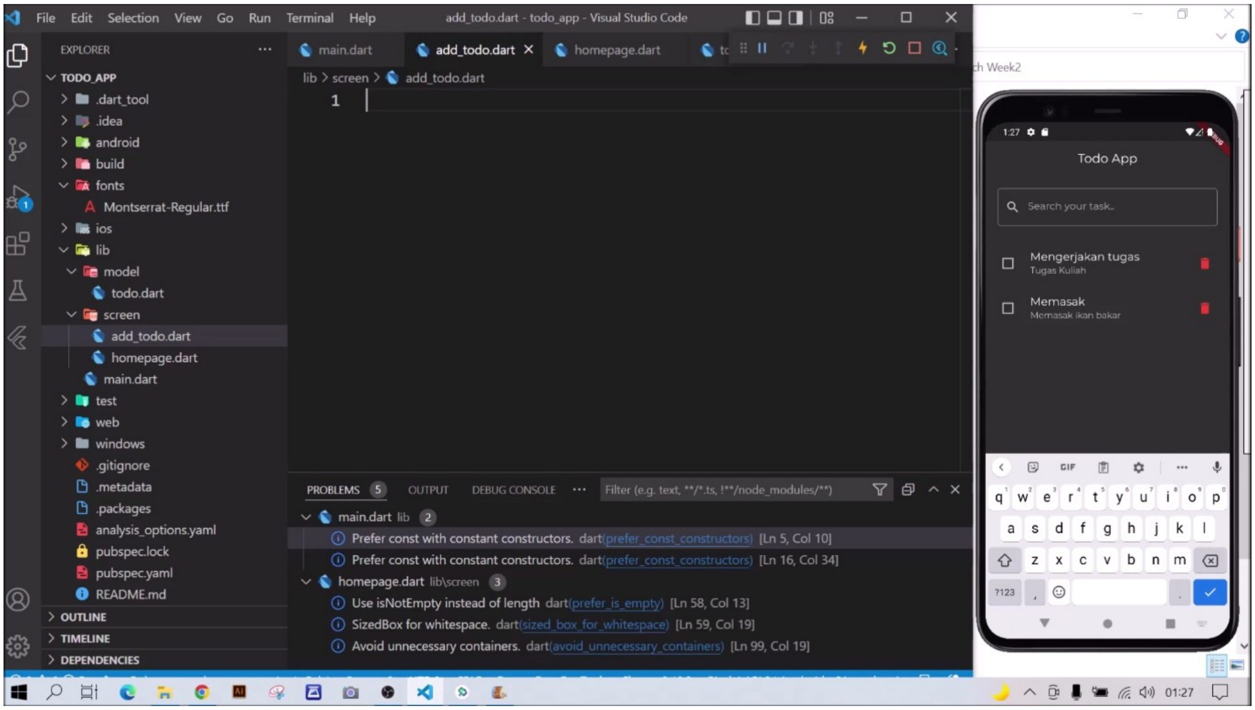
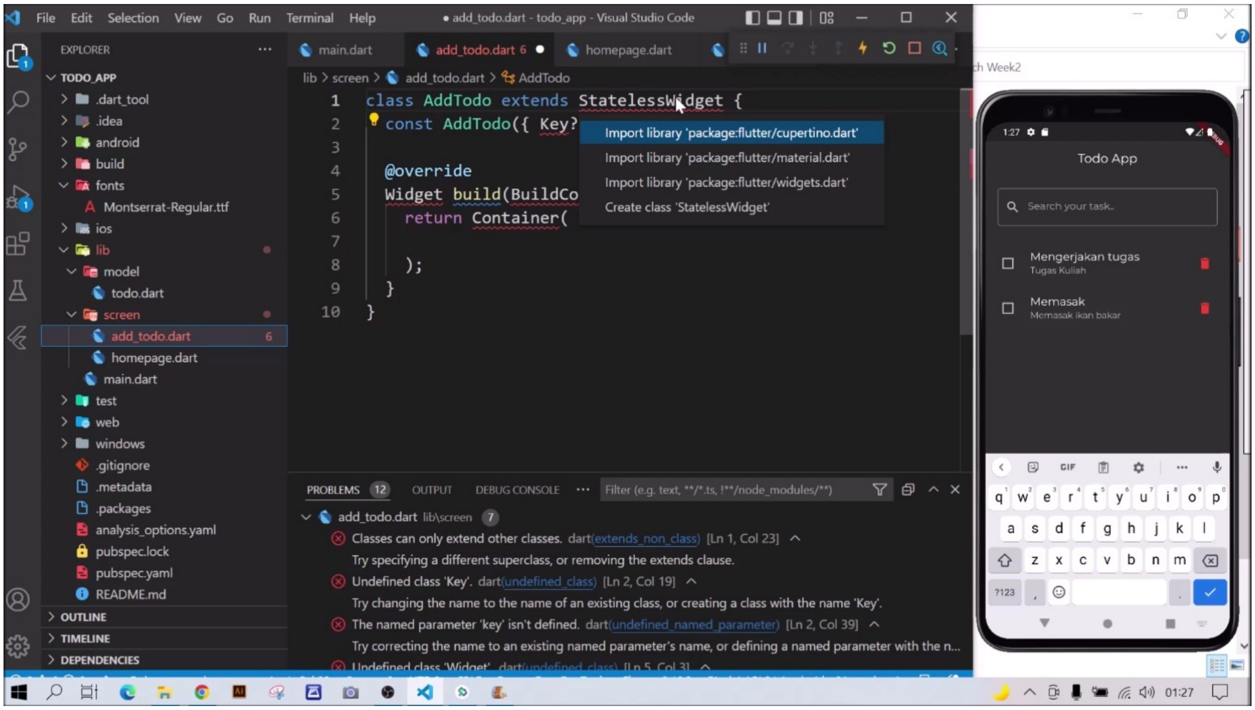
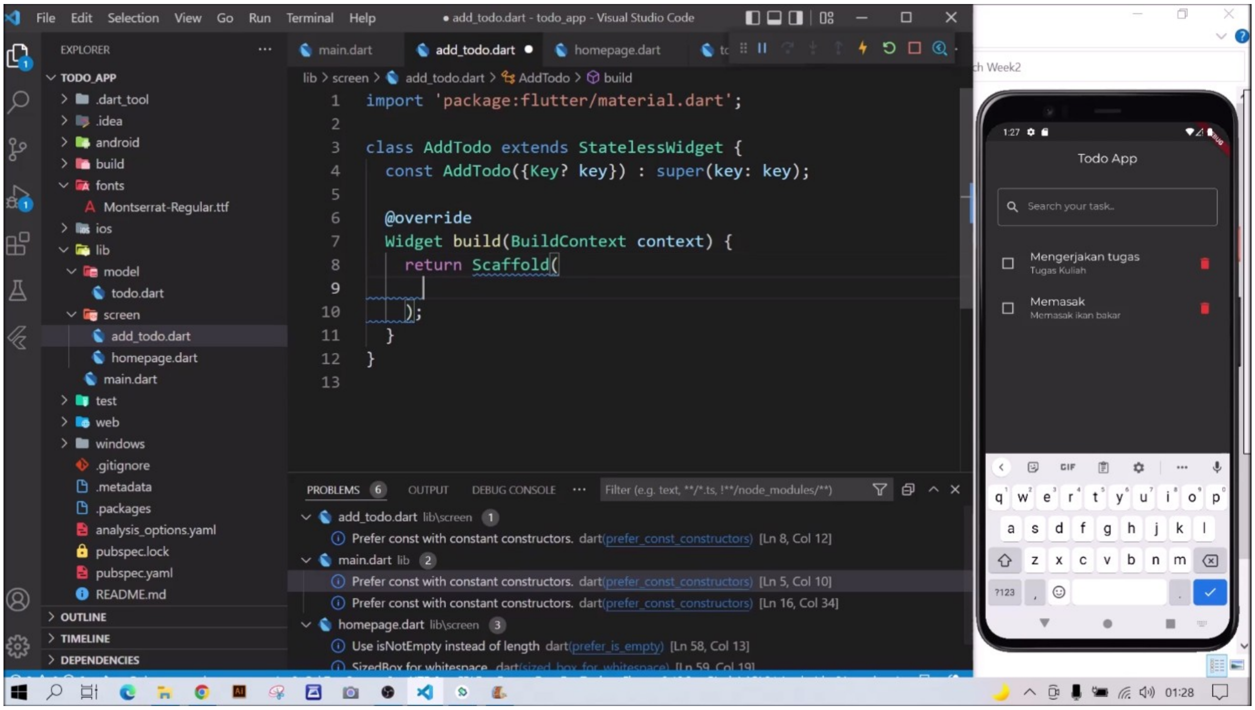
Melanjutkan todo app
Akan menambahkan fitur tambah data
Pertama kita buat dahulu screen baru
Yaitu



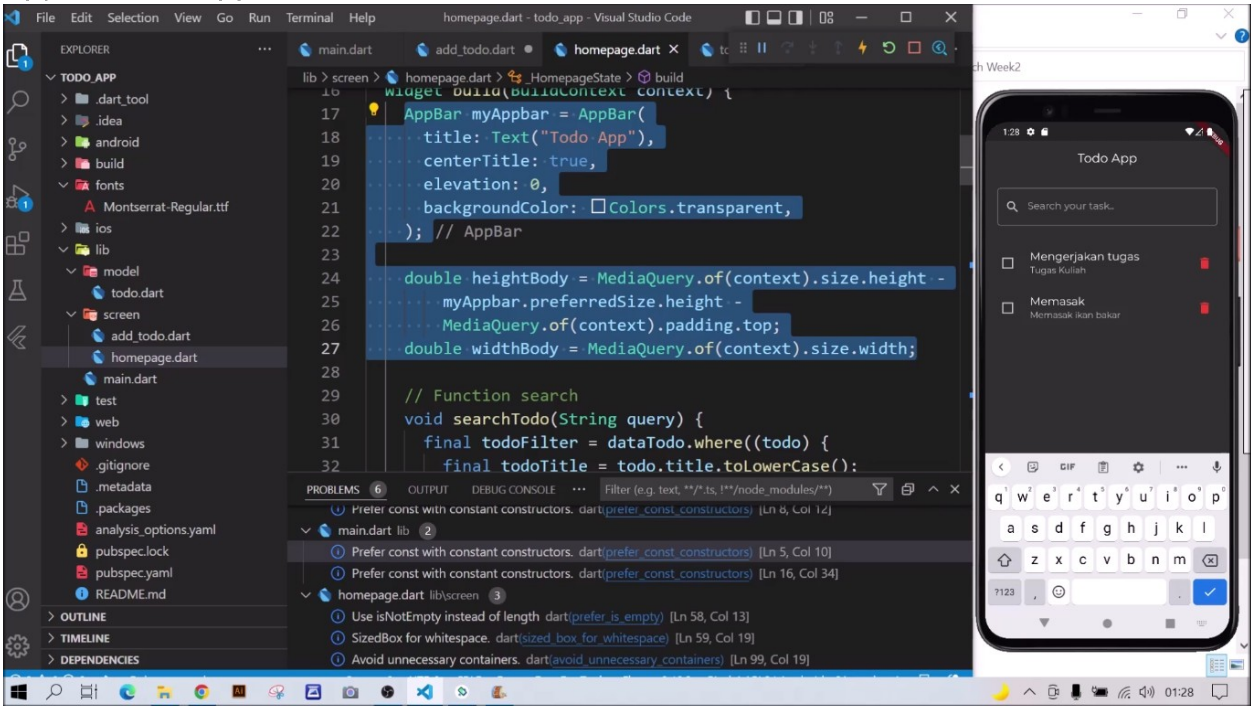
Disini bentuk stl addTodo



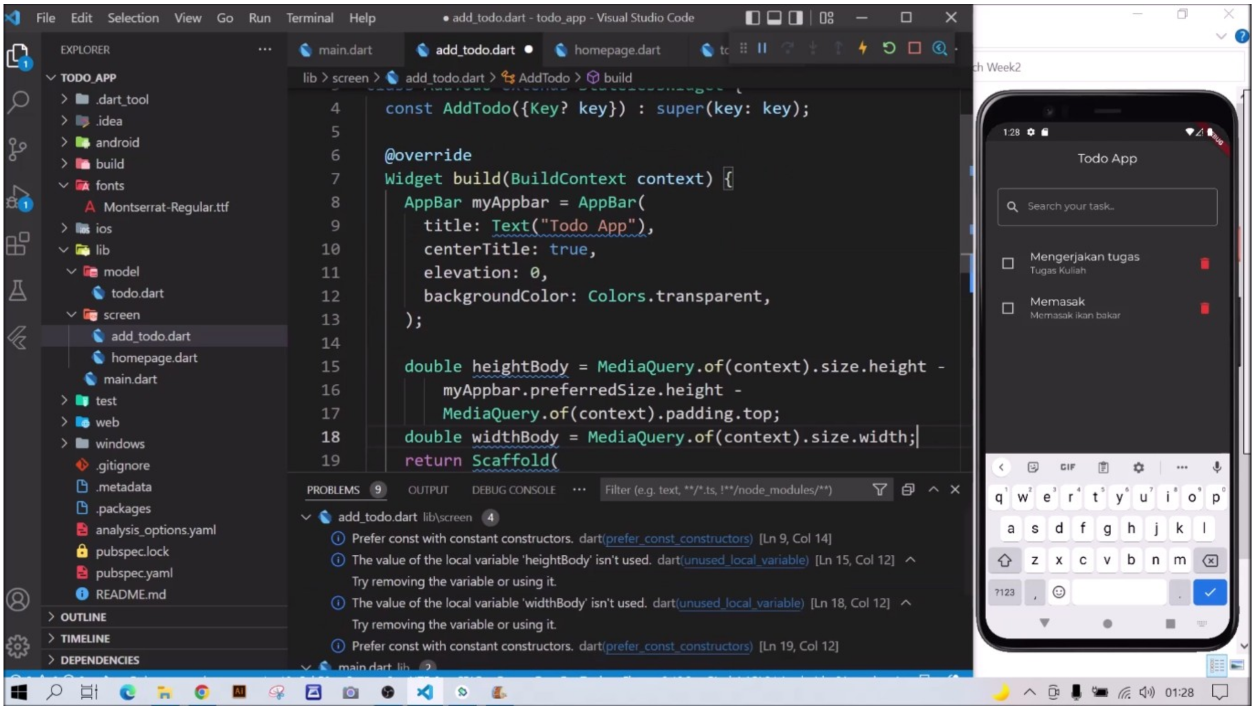
Lalu import material dartnya



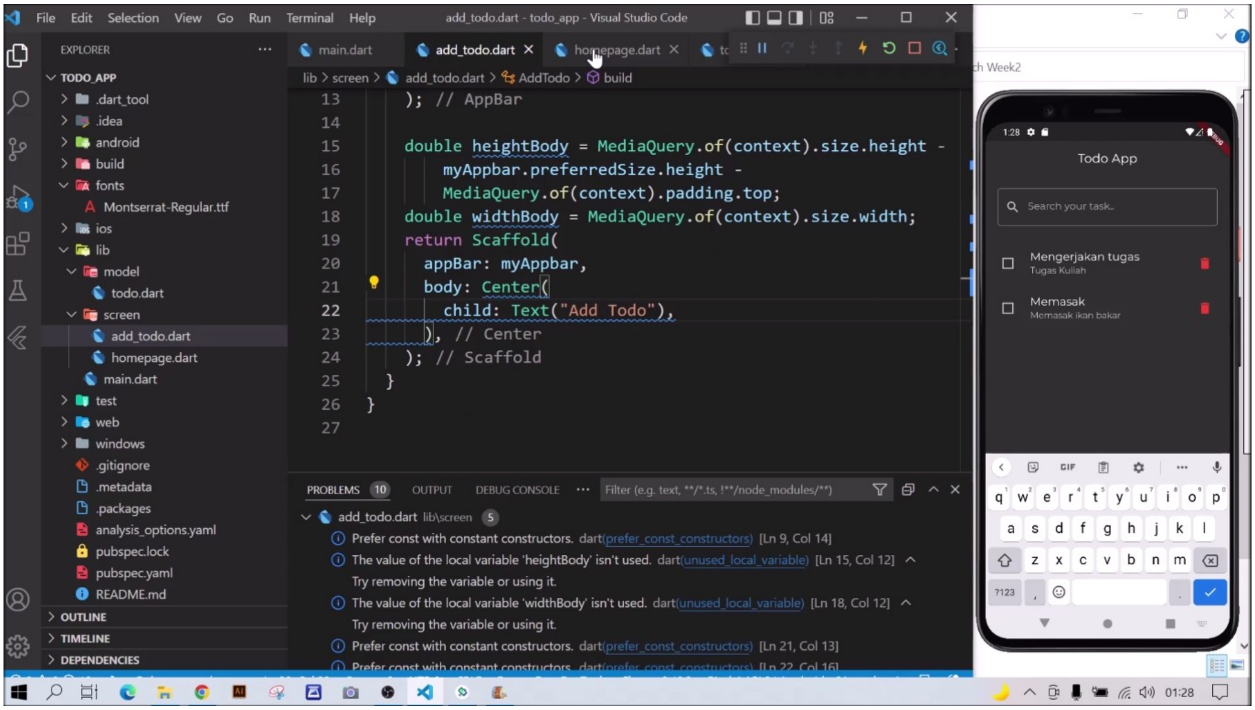
Isinya scaffold()
Kemudian di homepage copy
Appbar kita copy disni



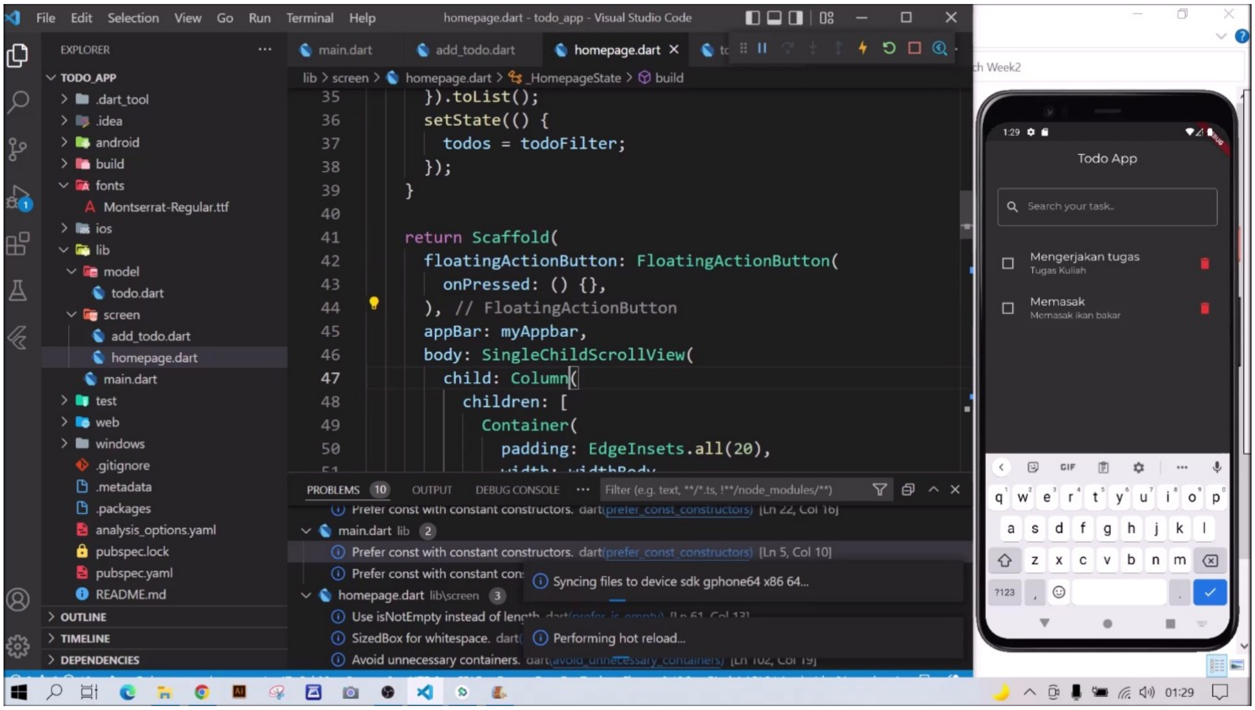
Kita paste disini



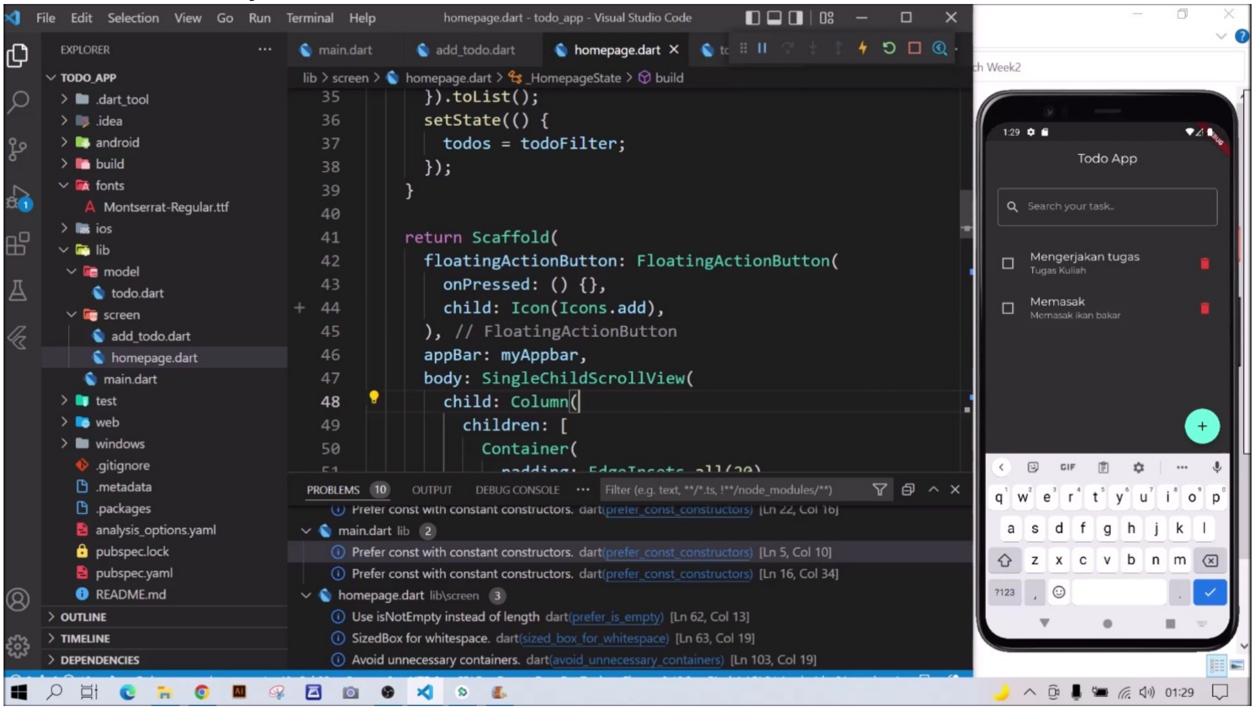
Buat didalam scaffold(
myAppBar,
)



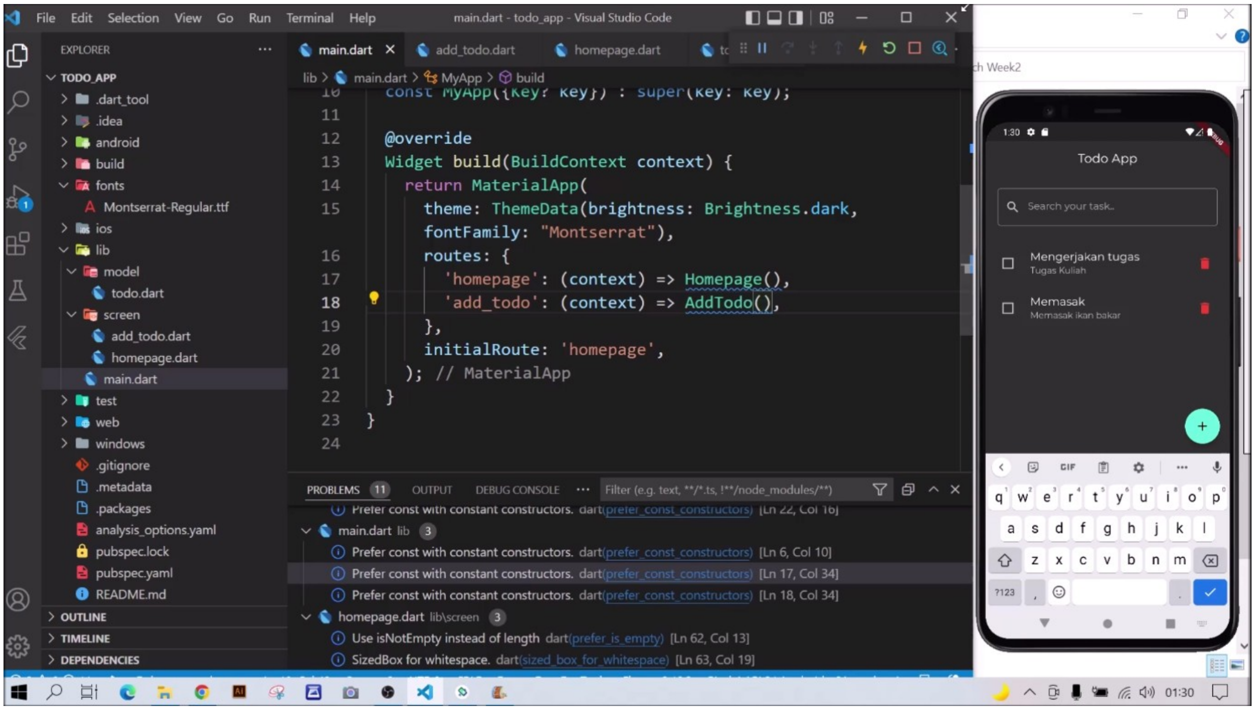
Dihalaman homepage kita buat floatingActionButton



Kita kosongi dulu lalu run
Kemudian childnya



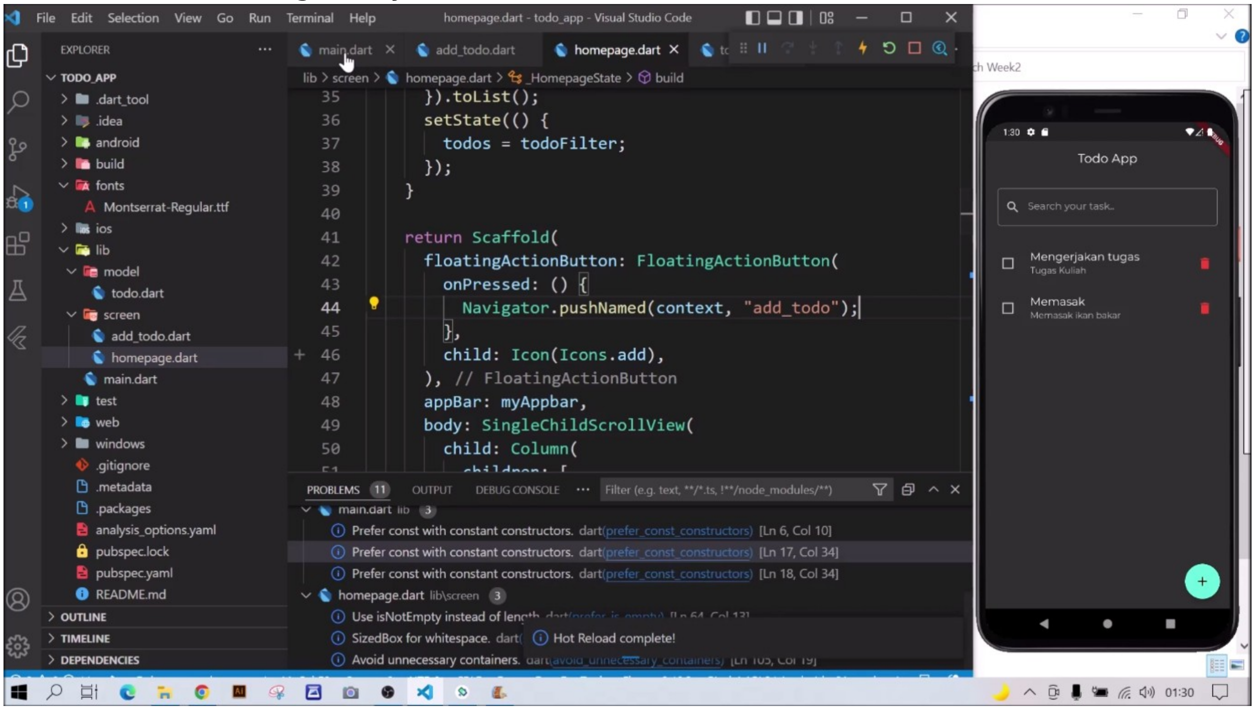
Nanti tampilan nya gitu
Pindah kehalaman addtodo
Kita buat dahulu di main
Buat add_todo



Maka auto import

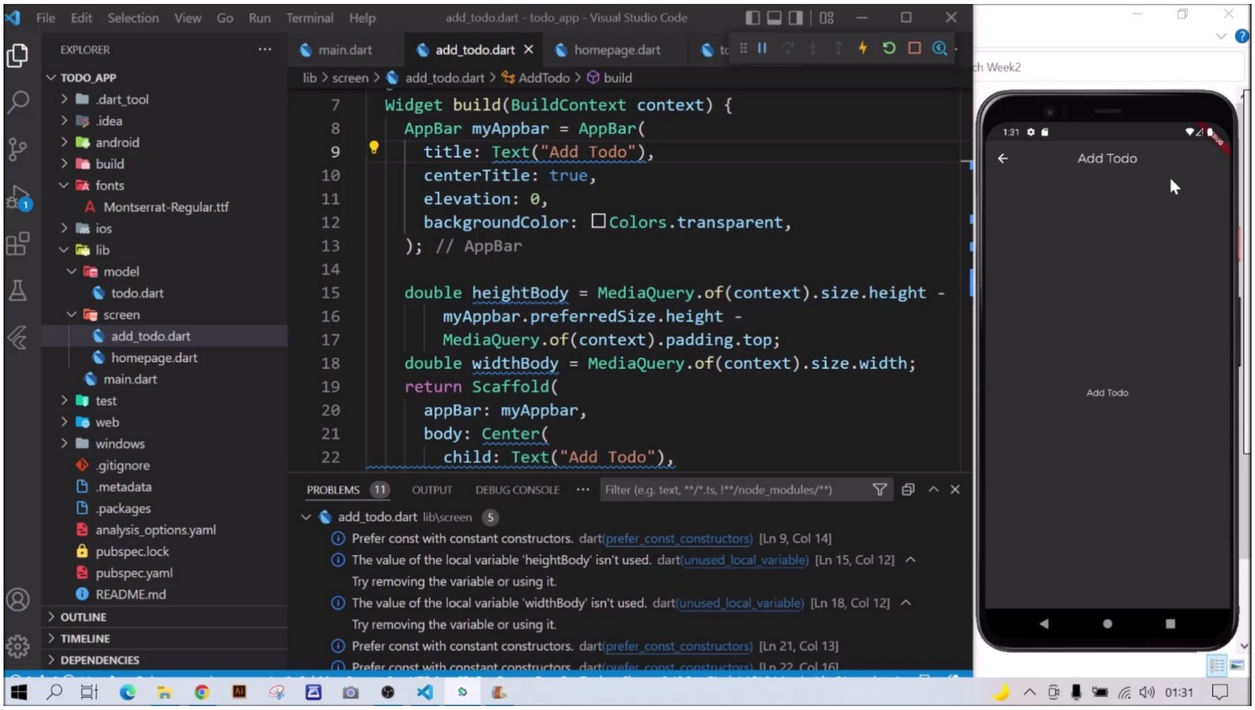
Klik tambah maka tidak terjadi apa2

Kita buat disini navigatornya

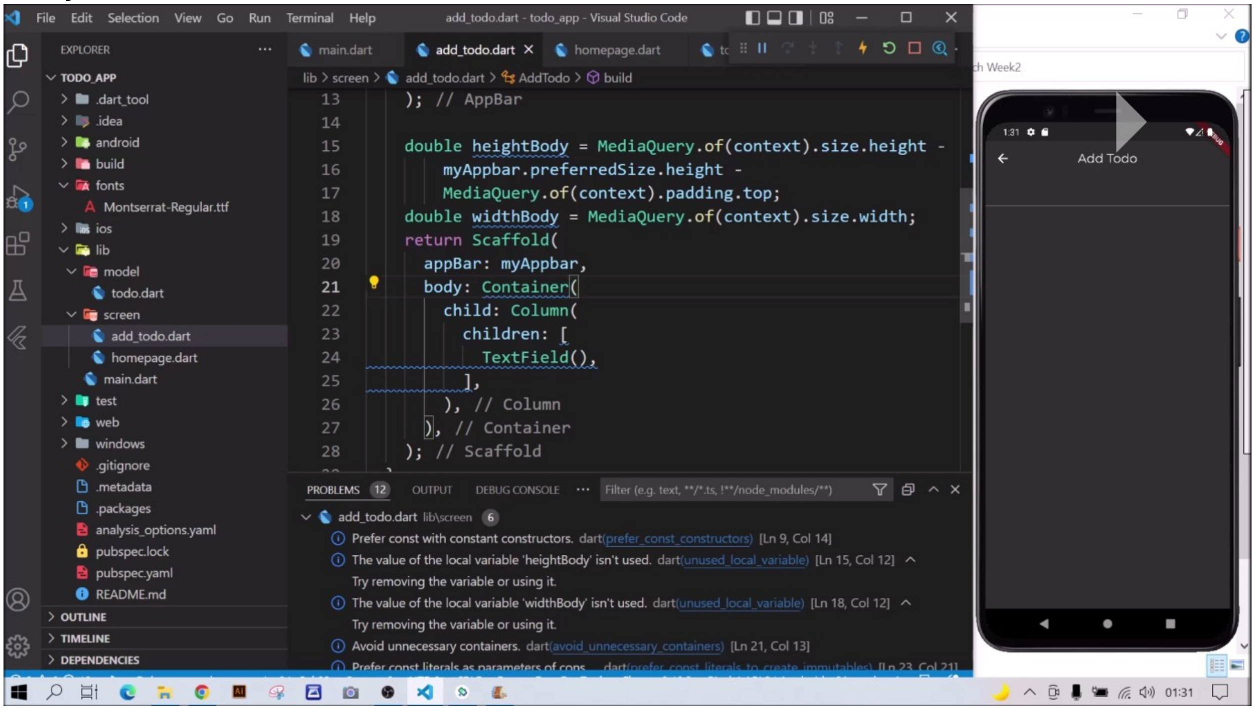


Maka diklik maka sudah pindah

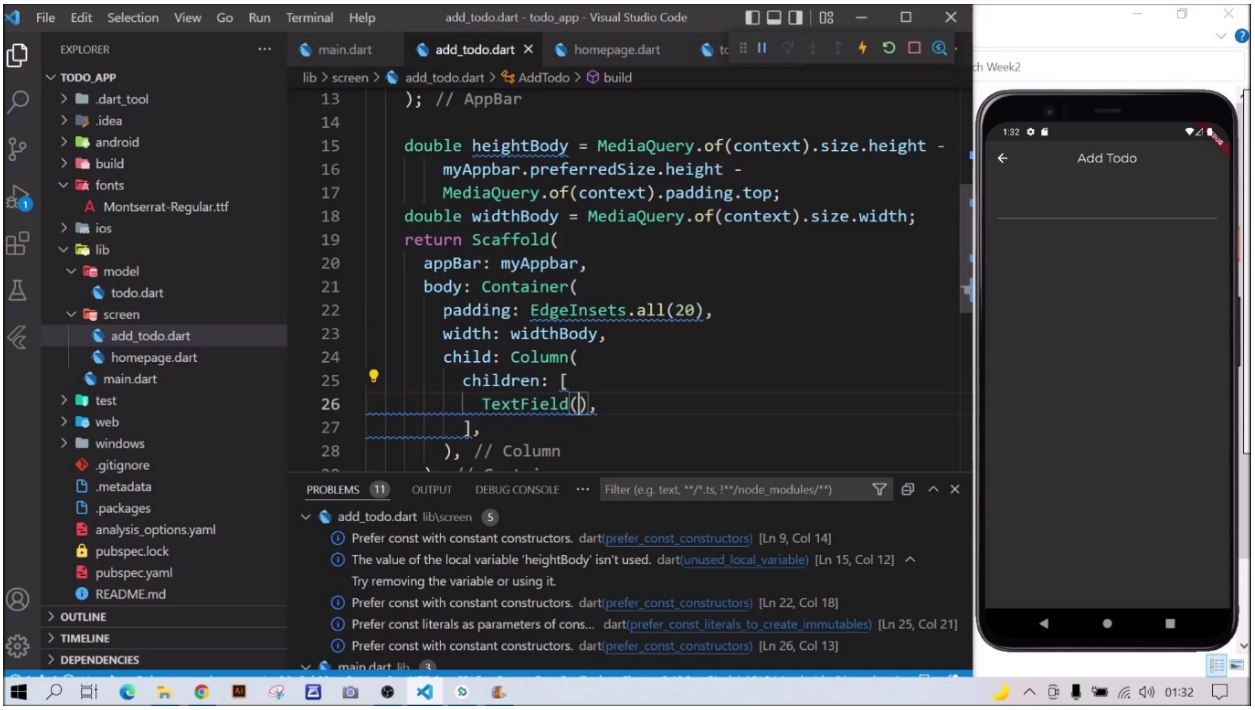
Kita gan ti titlenya



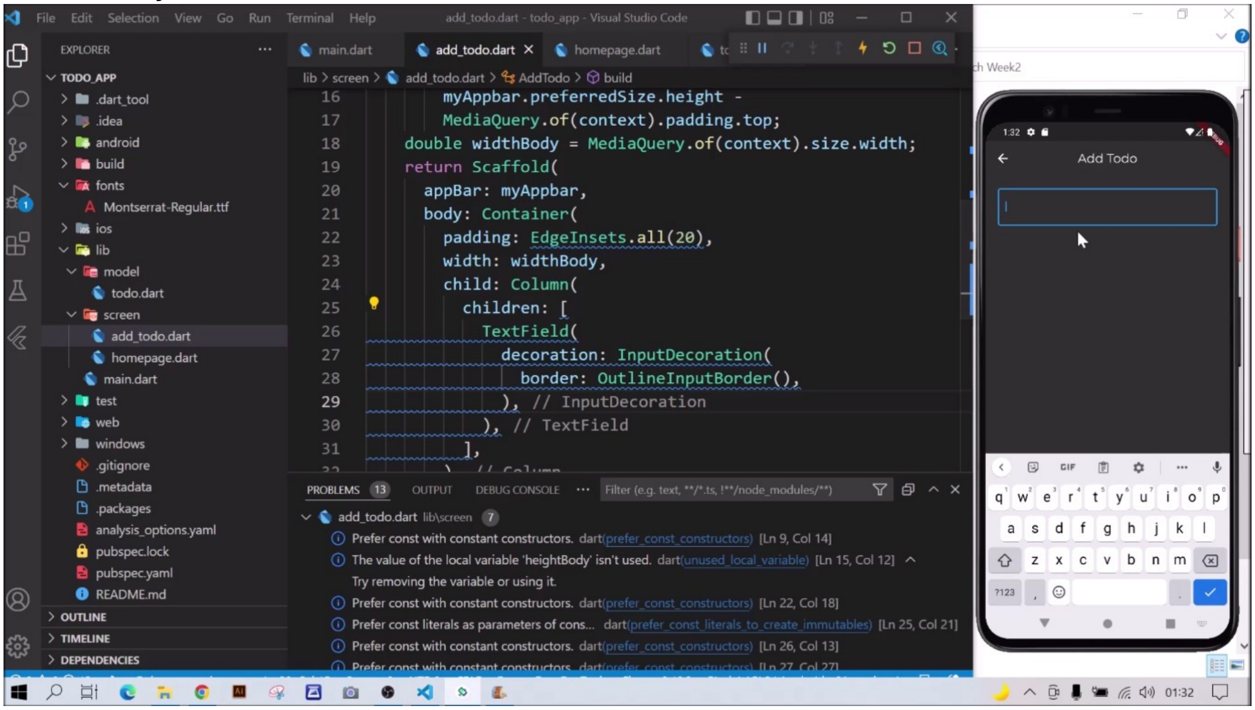
Tinggal kita buat body
Body: Columnn(
)
Isi nya children textfiled



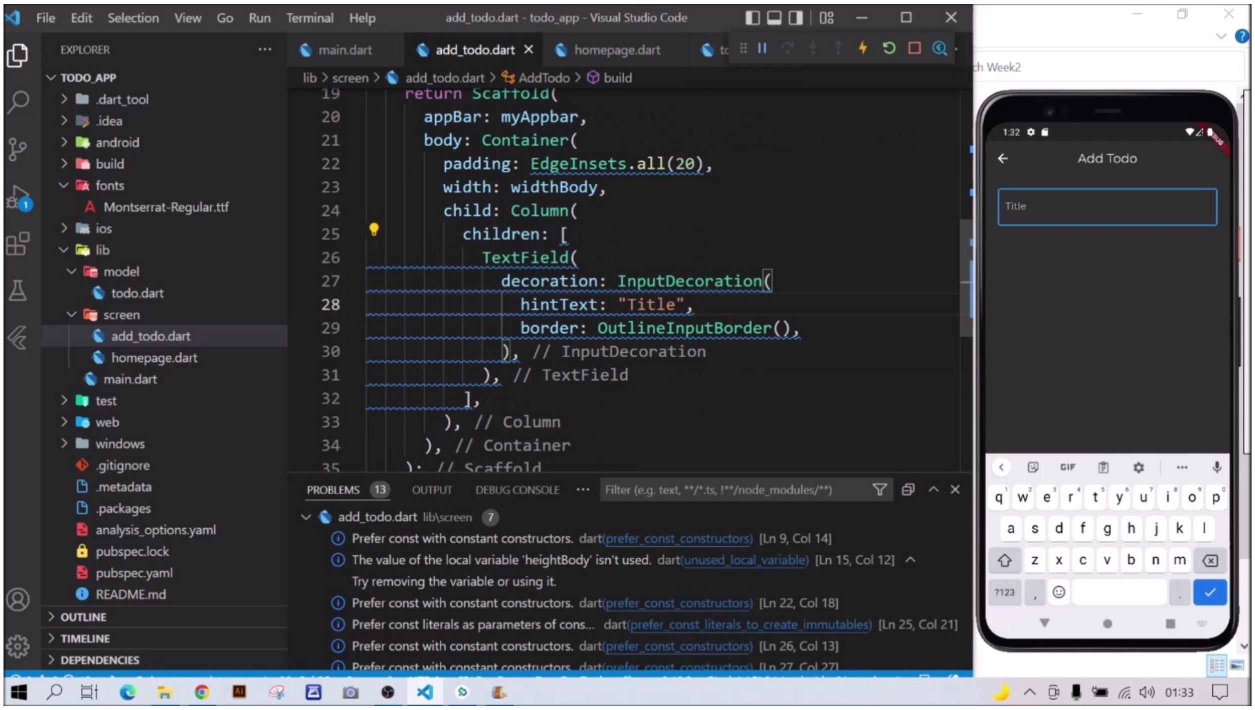
Dia mempunya width
Kasih padding



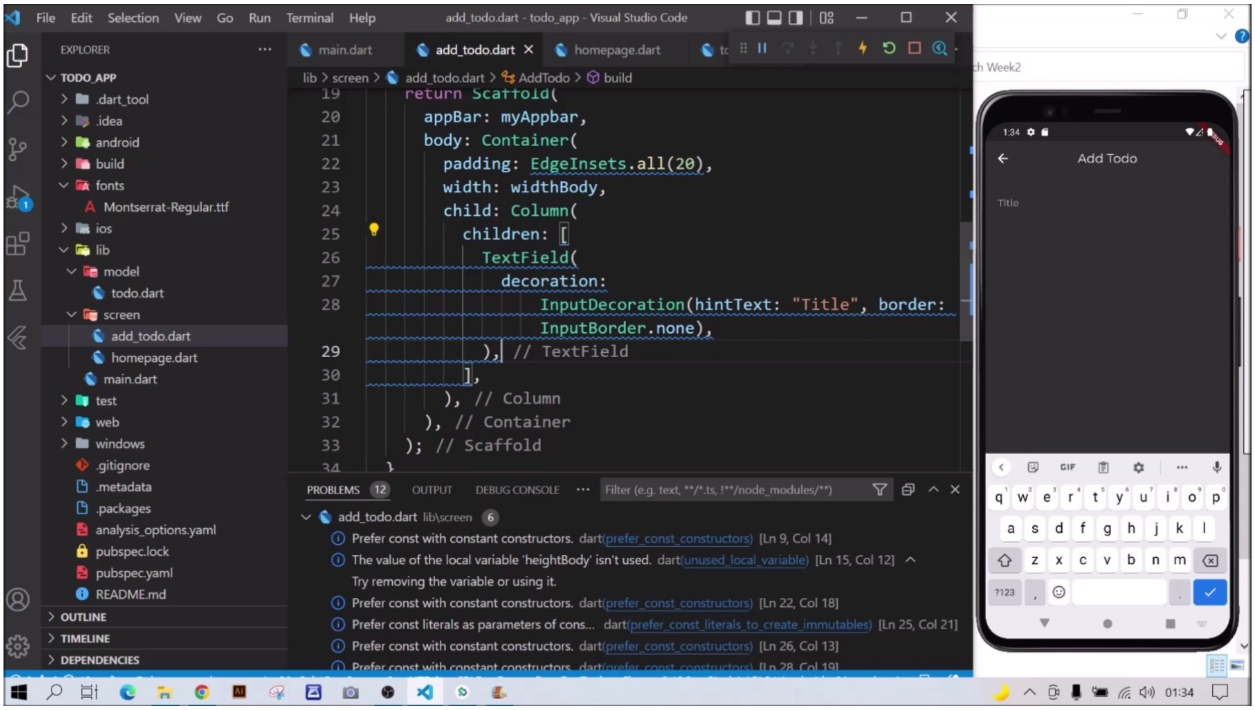
Textfiled nya kita decorasi



Kita memberikan hintext

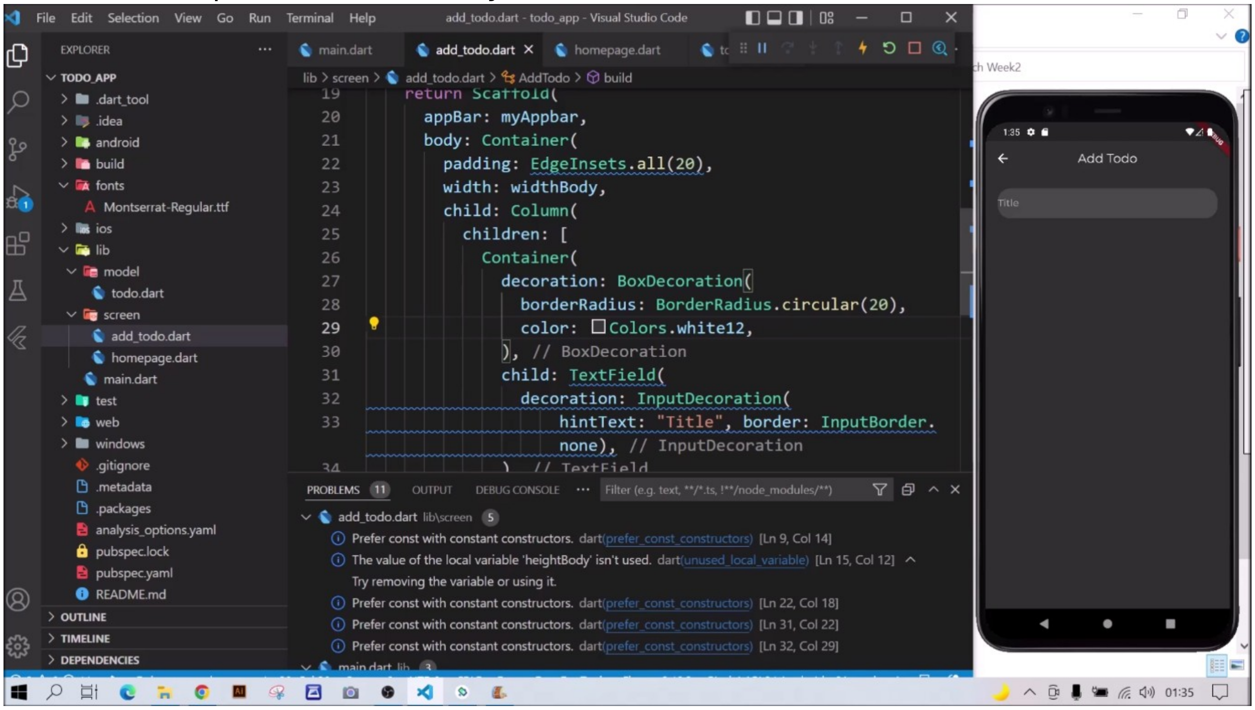


Kemudian di textfield sudah punya ini
Kita ubah sedikit
Kita pingin backround textfield
Tinggal kasih backroundcolor
No border

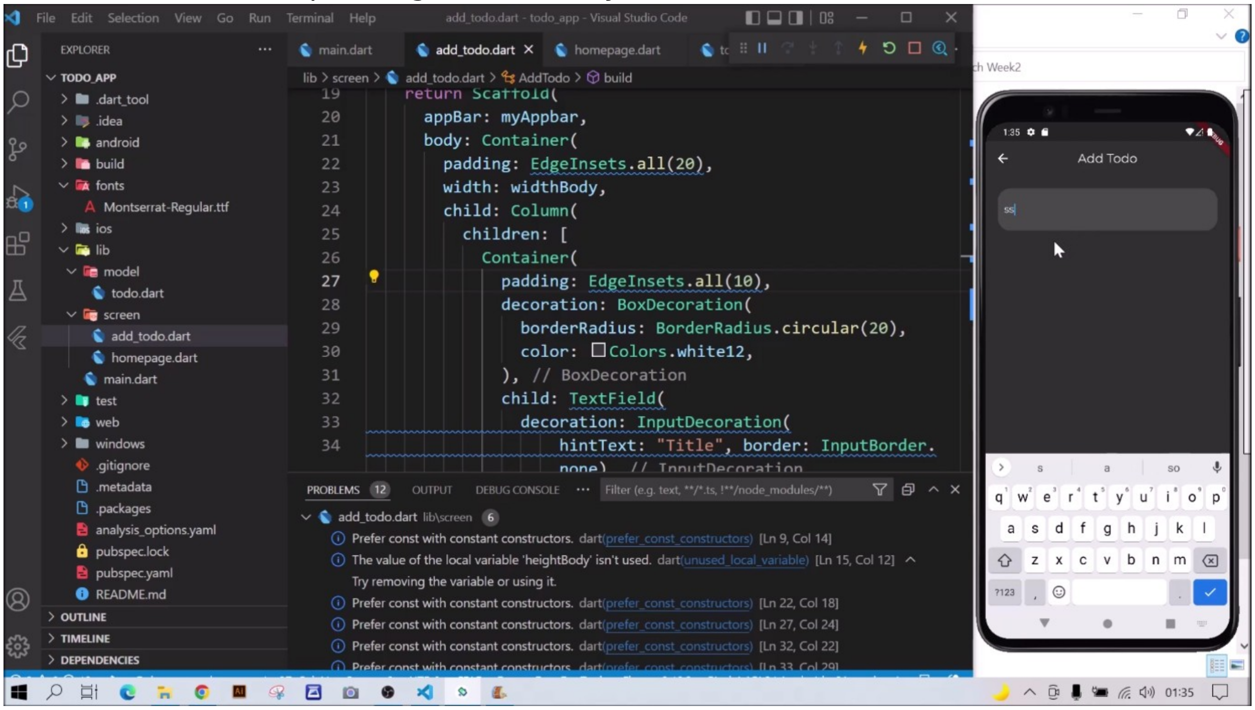


Maka border hilang kemudian
Textfield di bungkus container di refactor swap dgn container
Lalu tambah decoration

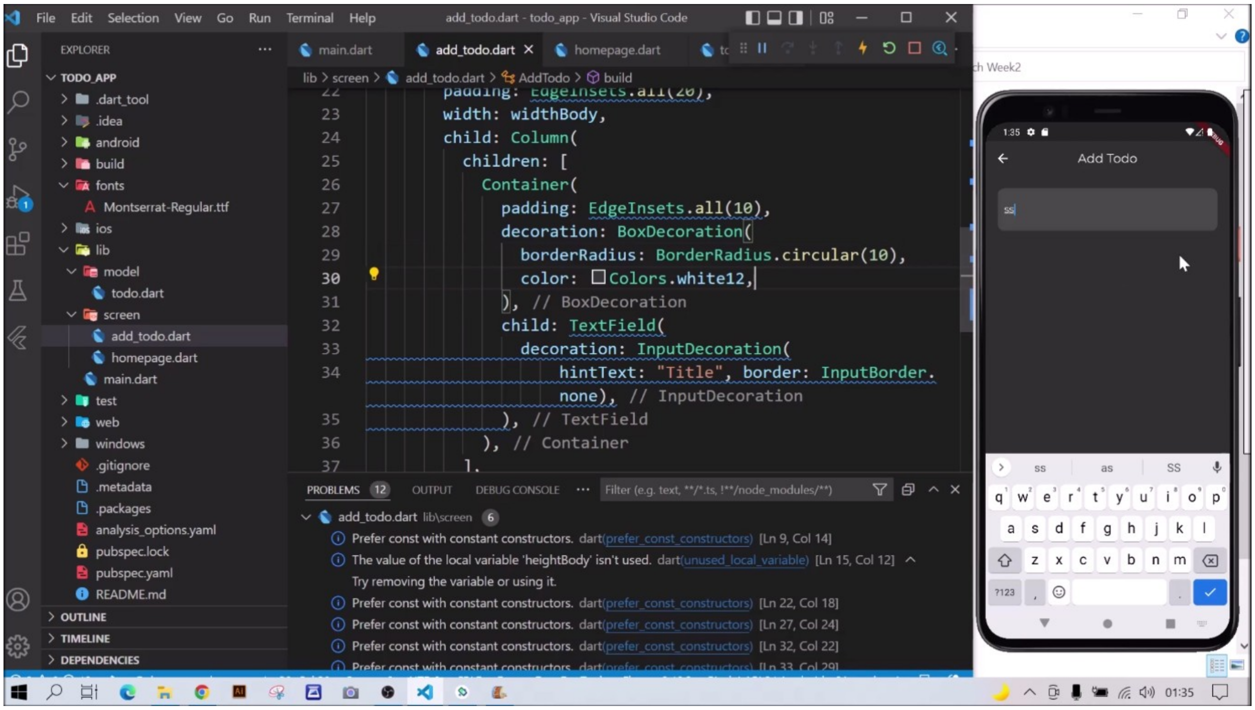
Lalu dikasih border radius
Untuk menumpulkan container nya



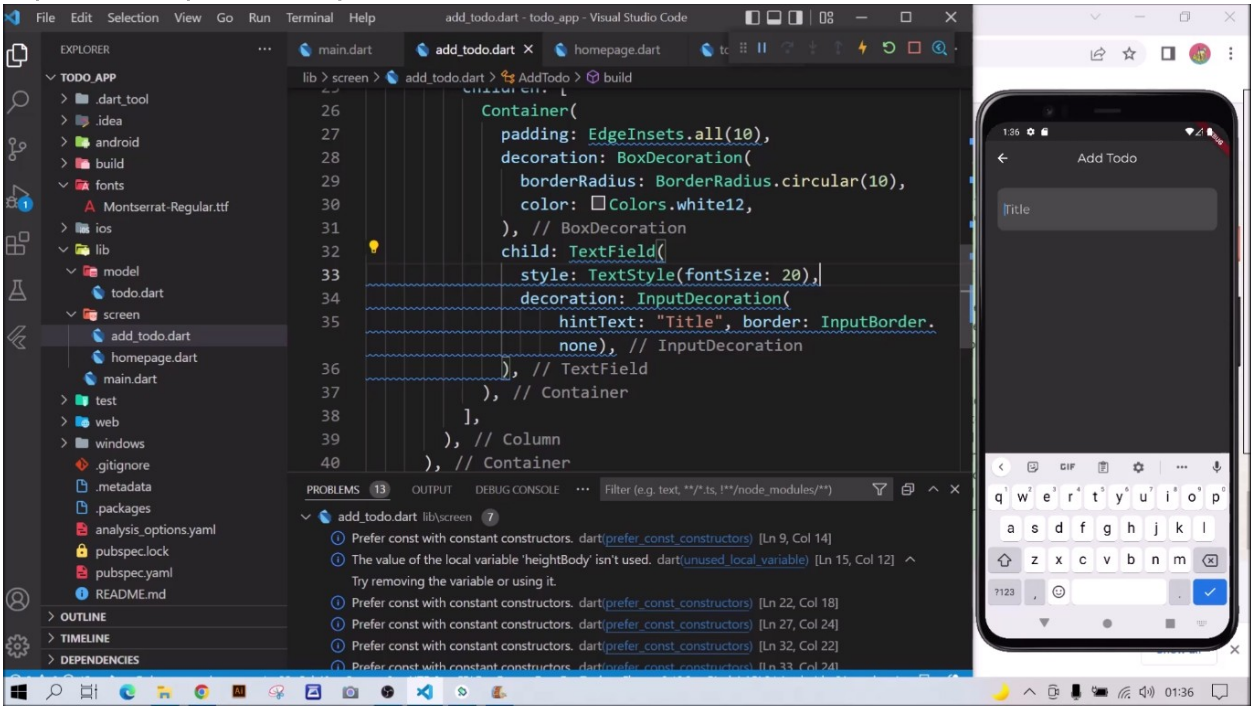
Kemudian kita kasih padding container nya



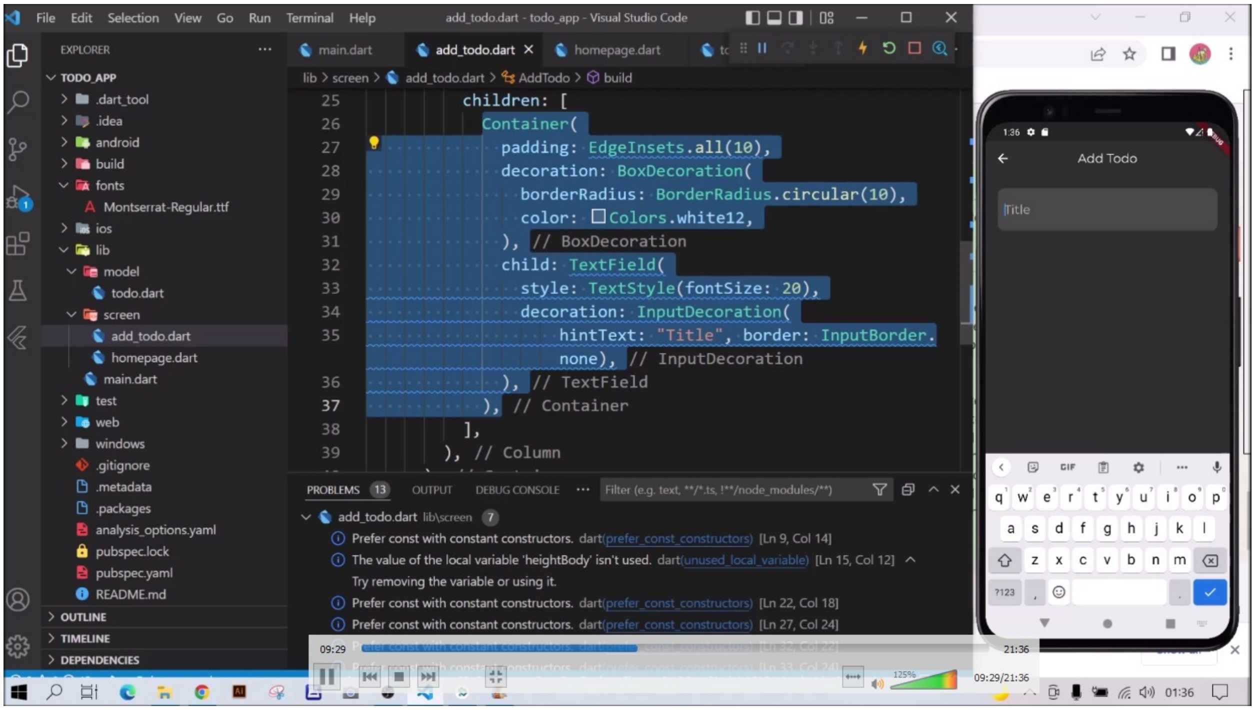
Kita ubah radiusnya jadi 10



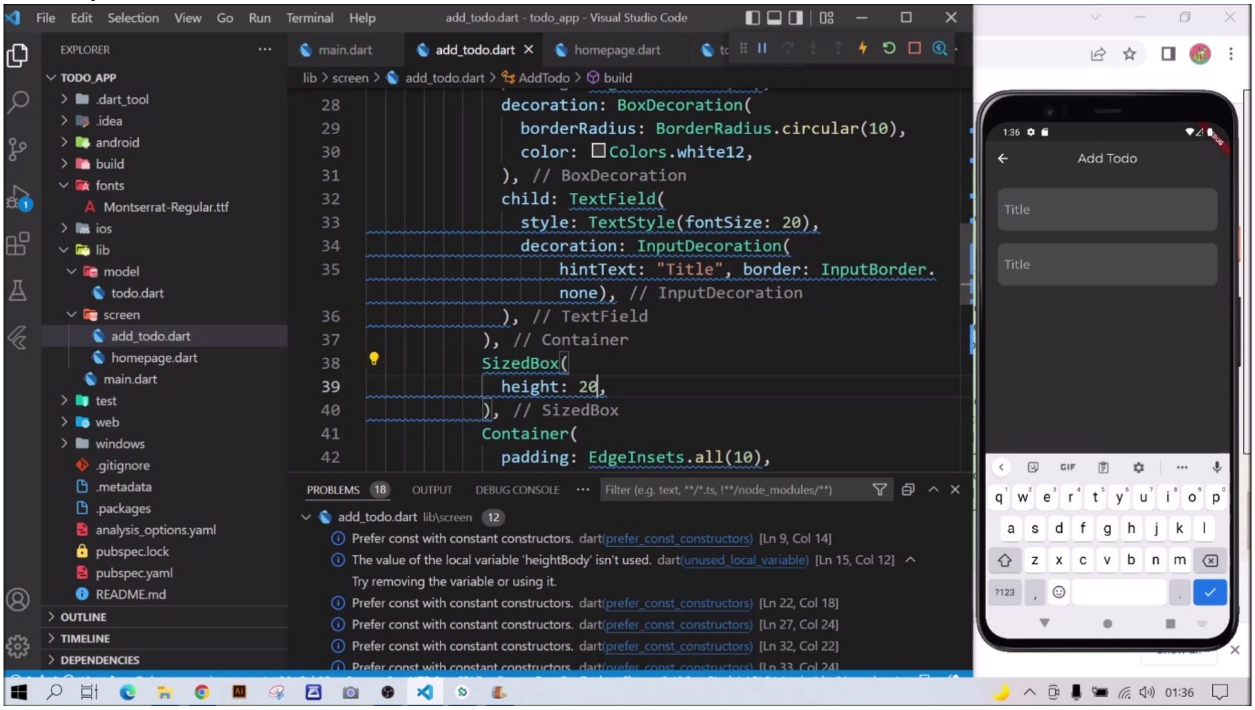
Agar tidak terlalu tumpul
Kemudian kita ganti
Style: textStyle font digedekan



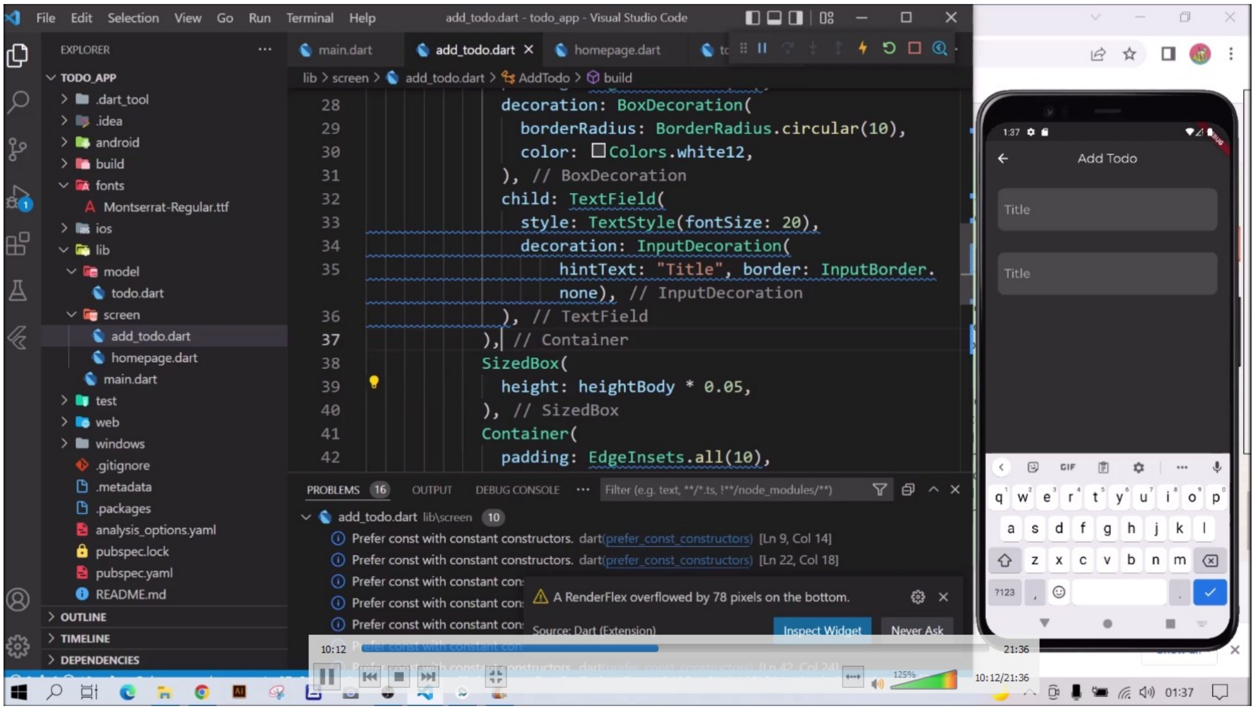
Kita sudah membuat titlenya
Kemudian kita buat describsinya
Kitra copy saja disini



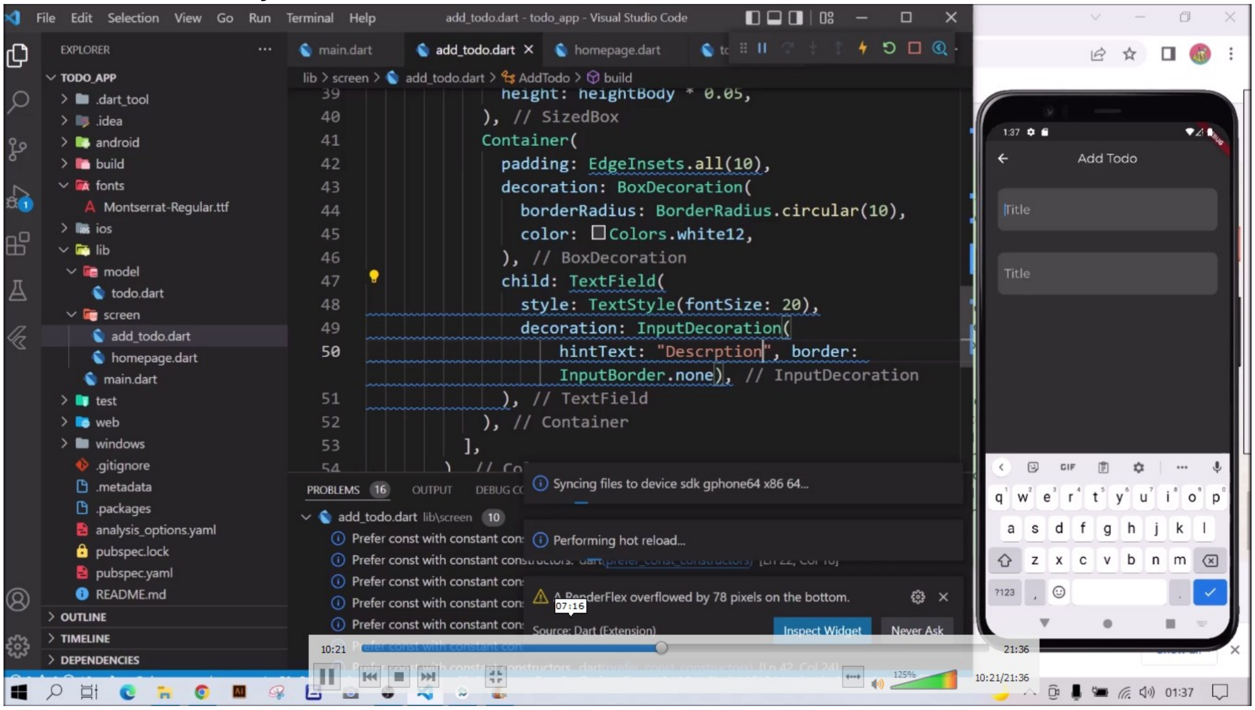
Kasih jarak



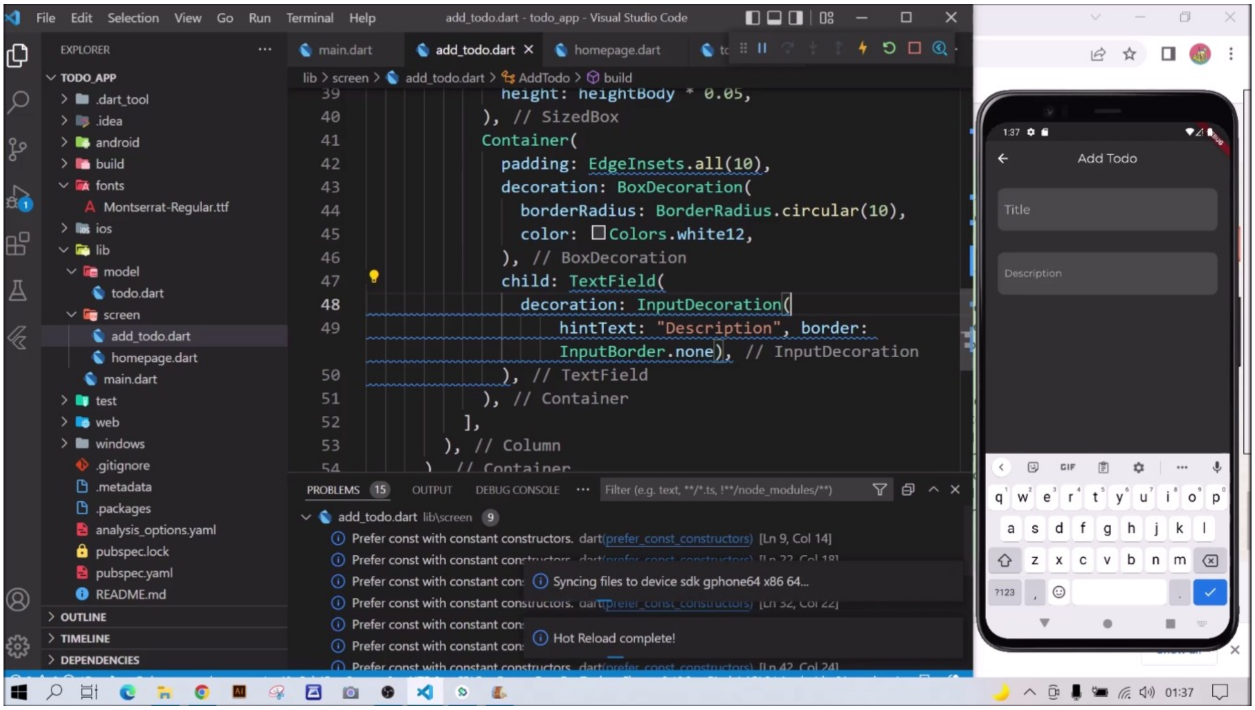
Agar responsive



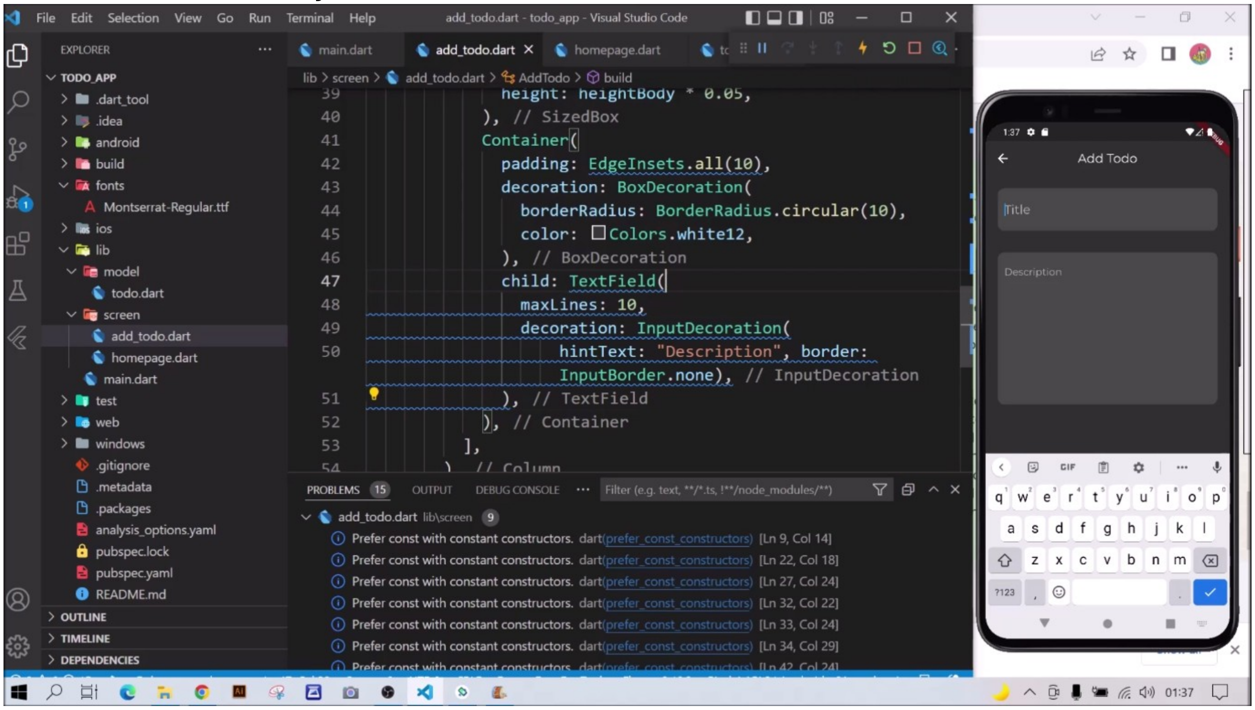
Ubah kata desc nya



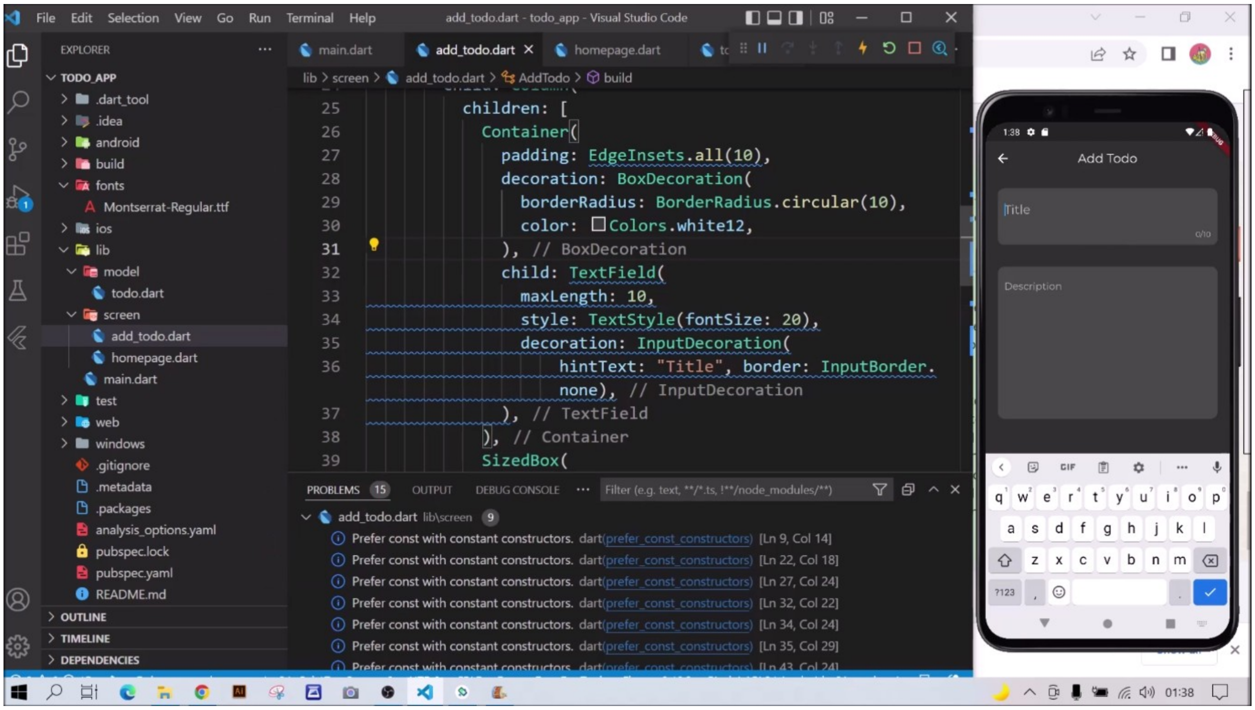
Fontsize hapus



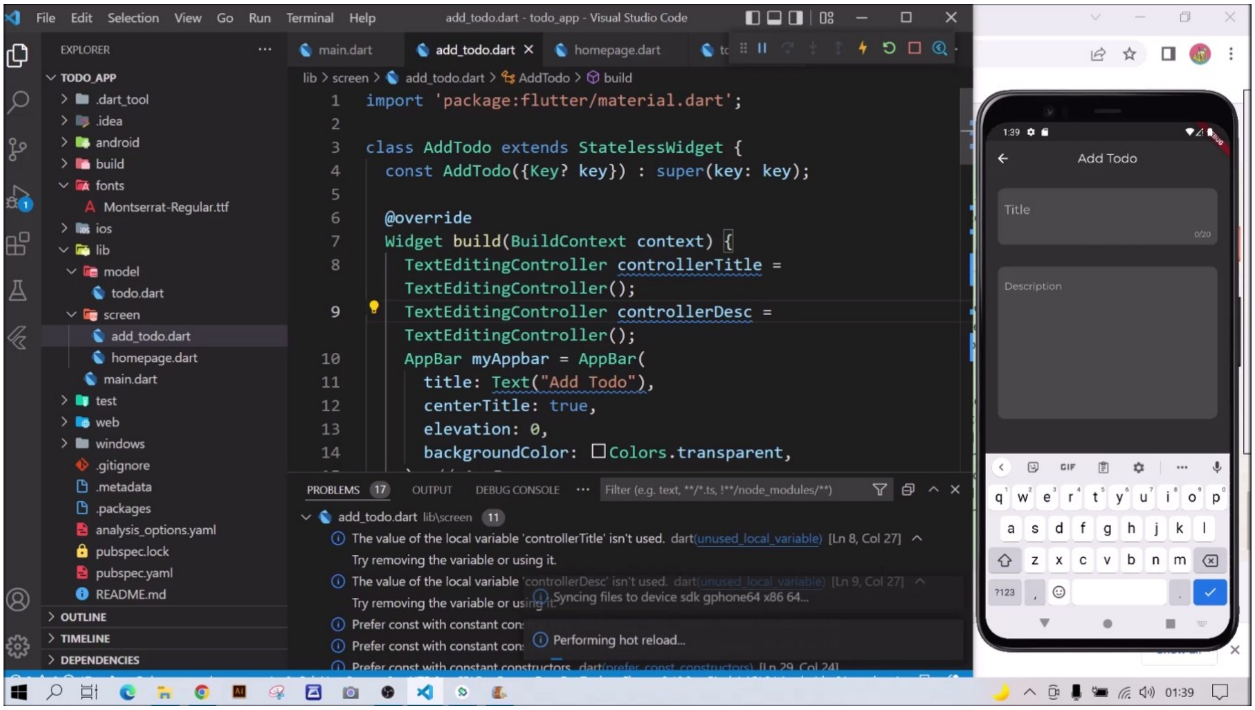
Describsi kasih line nya 10



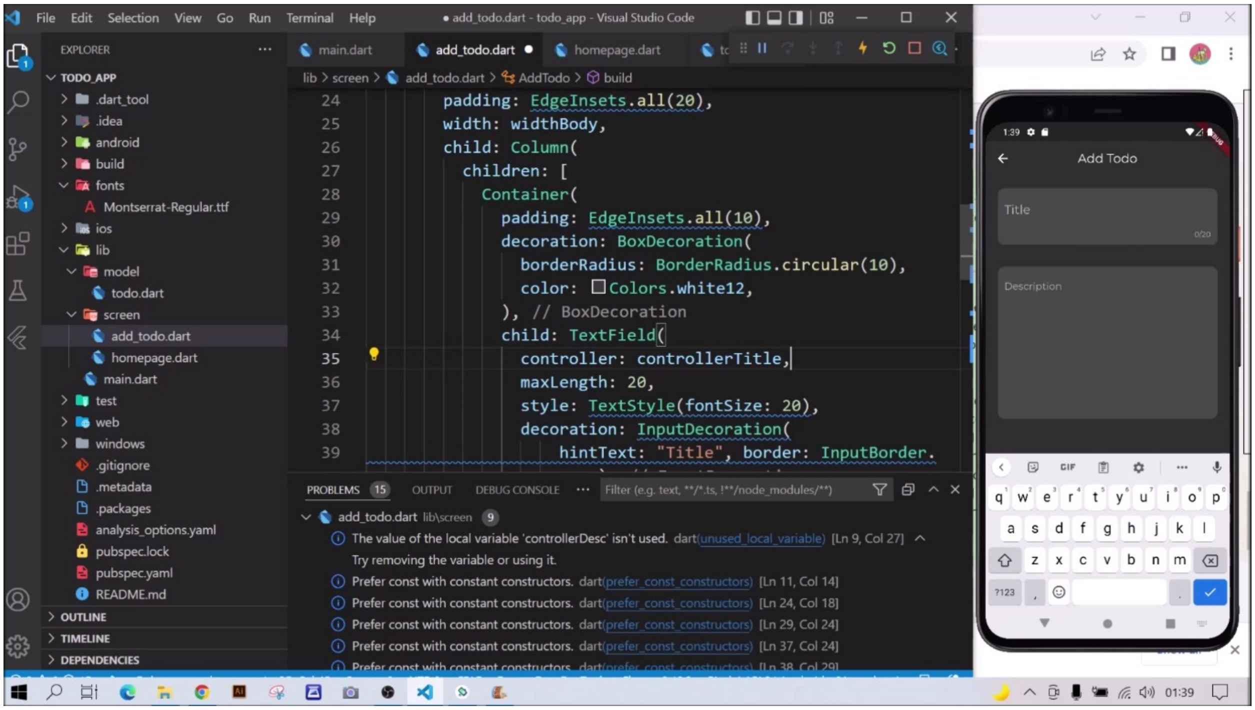
Kalau title kasih
Maksimal hanya 10 karakter



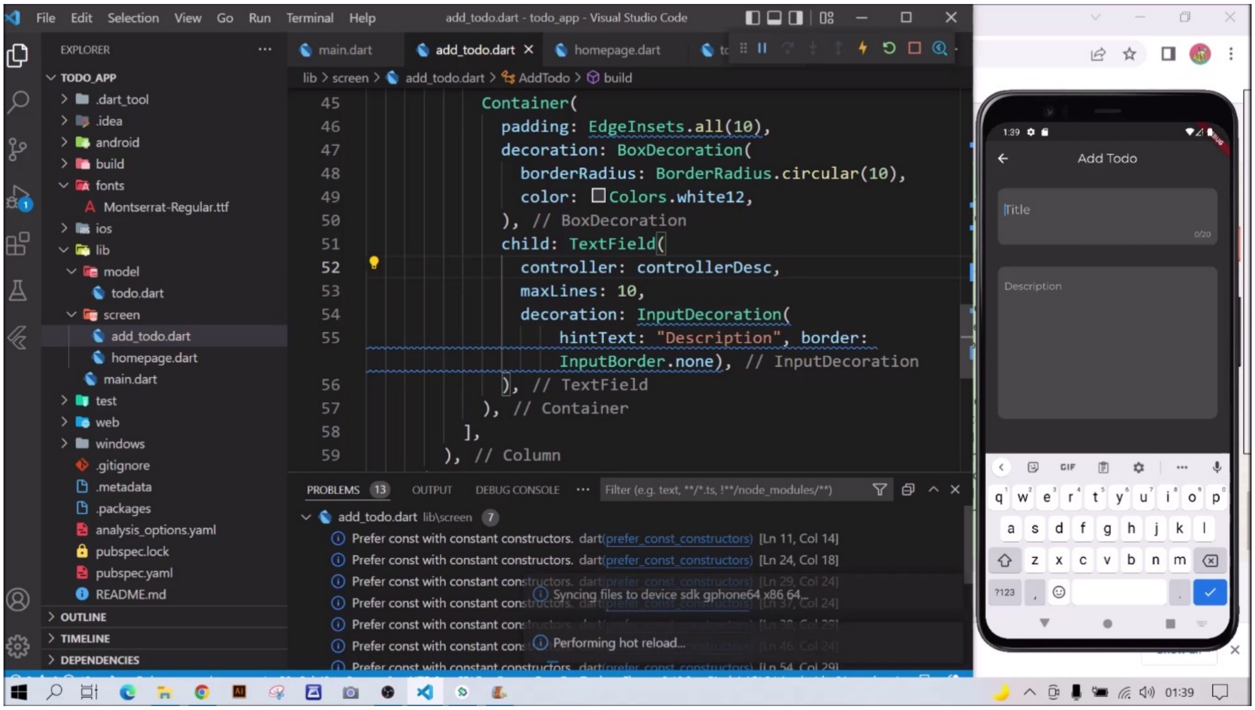
Sudah membuat 2 textfiled
Kemudian buat contoler nya juga
Didalam context
Pertama buat title
Kedua buat desc



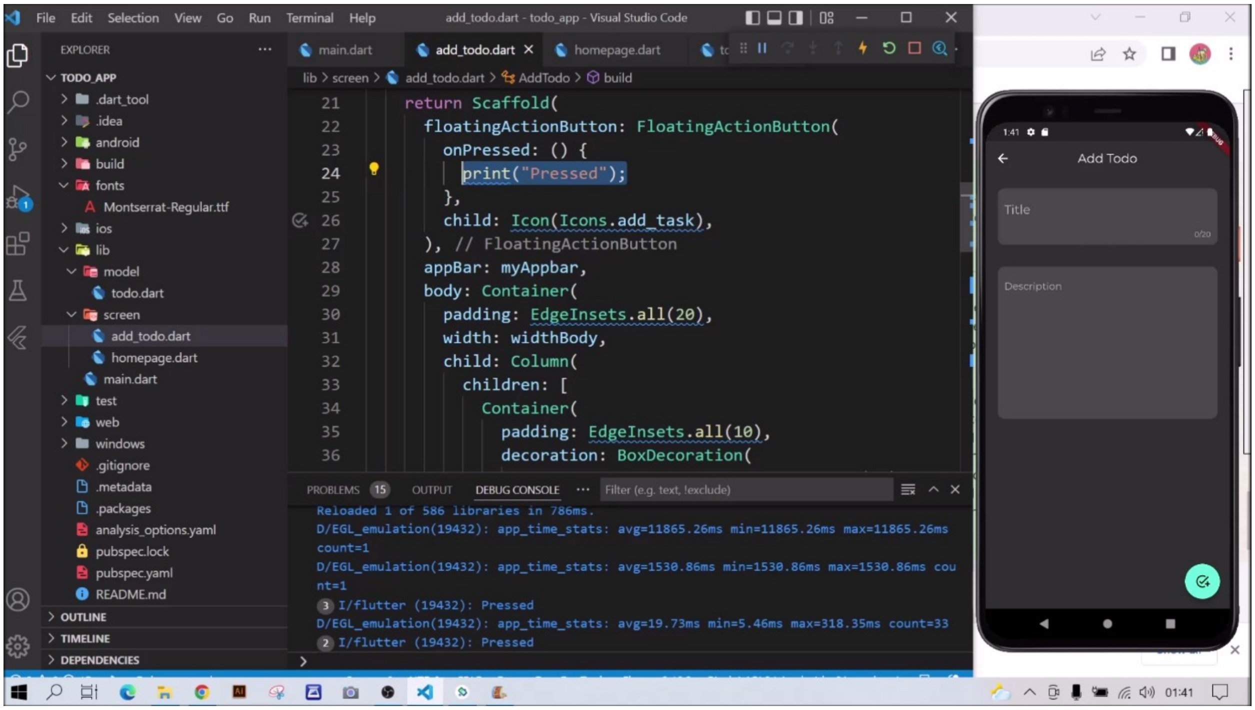
Maka sudah punya controller kita masukan
Kita masukan kedalam pertma untuk title



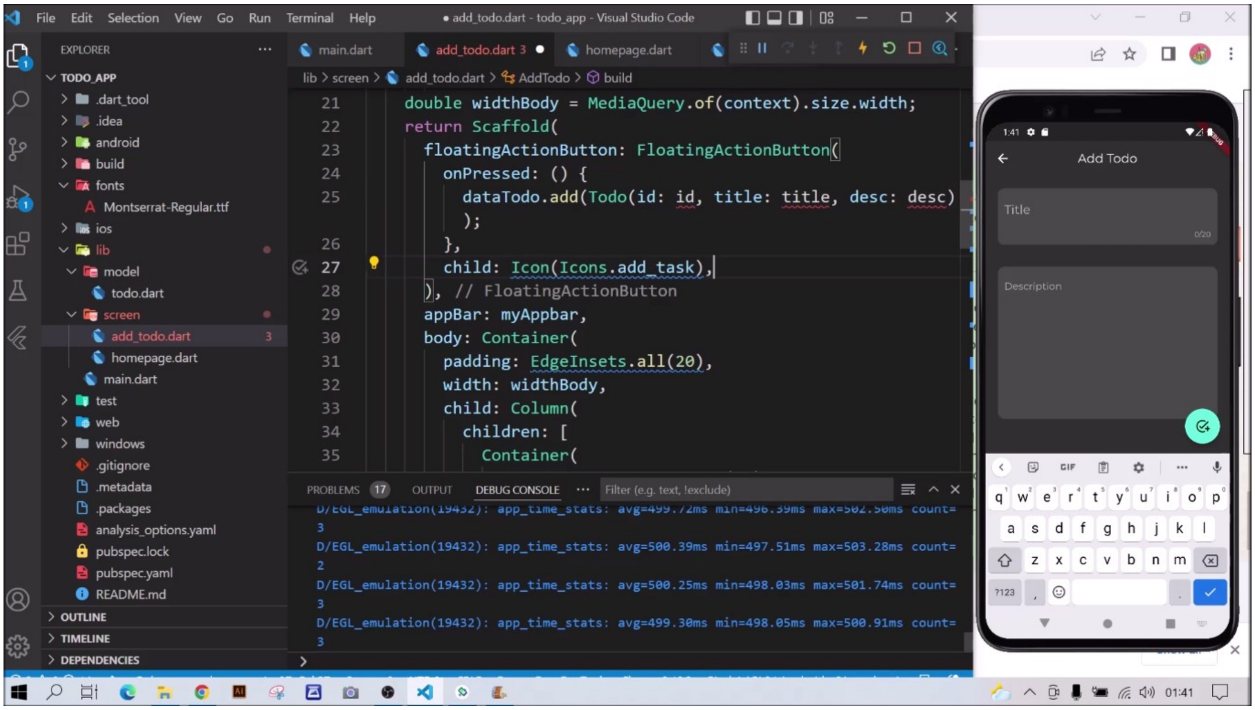
Untuk des



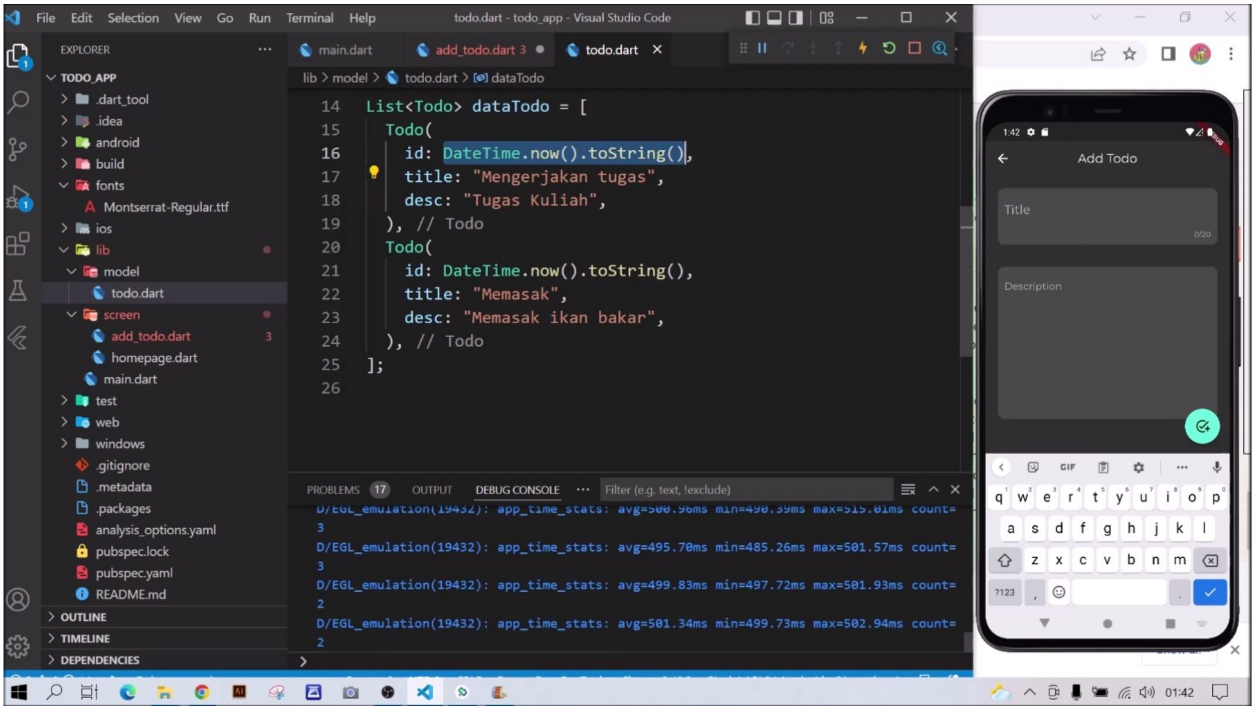
Disini buat floating button juga ketika di klik mka bertambah
Kita buat scaffold



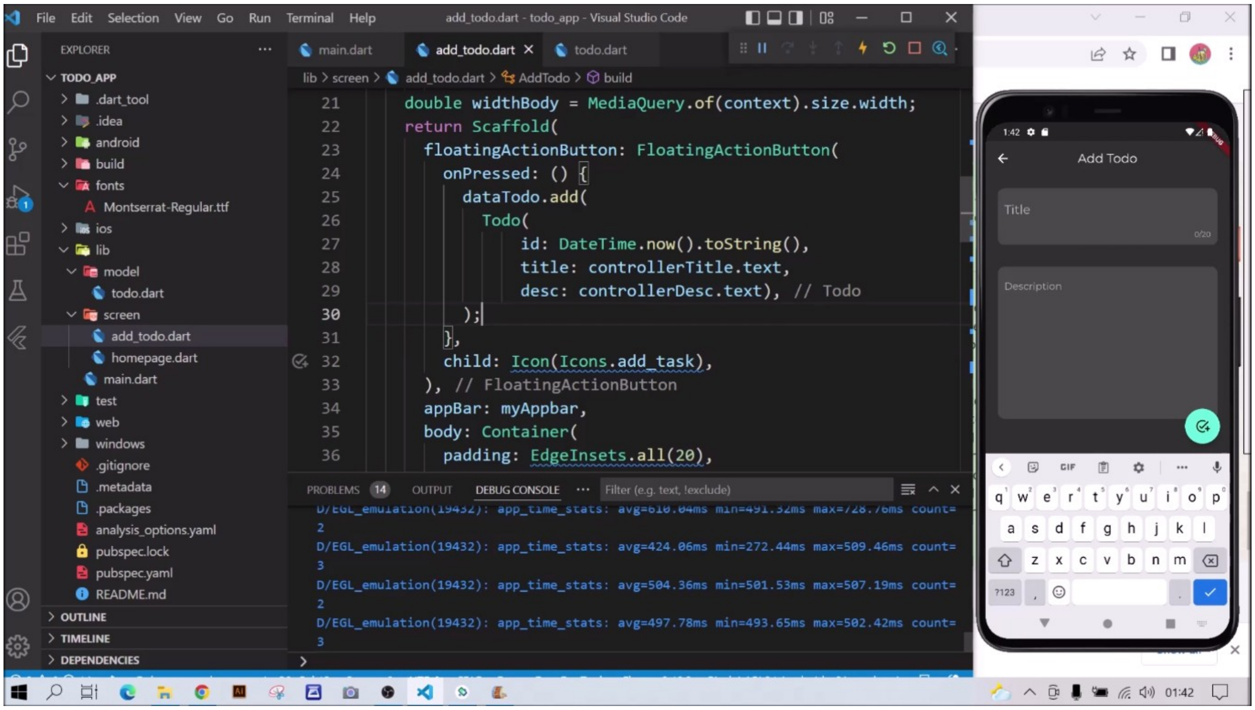
Ketika diklik maka menambahkan data kalau ini ditekan amaka ada pressed
Kita mengunakan add
dataTodo.add kita ambil class todo di tab



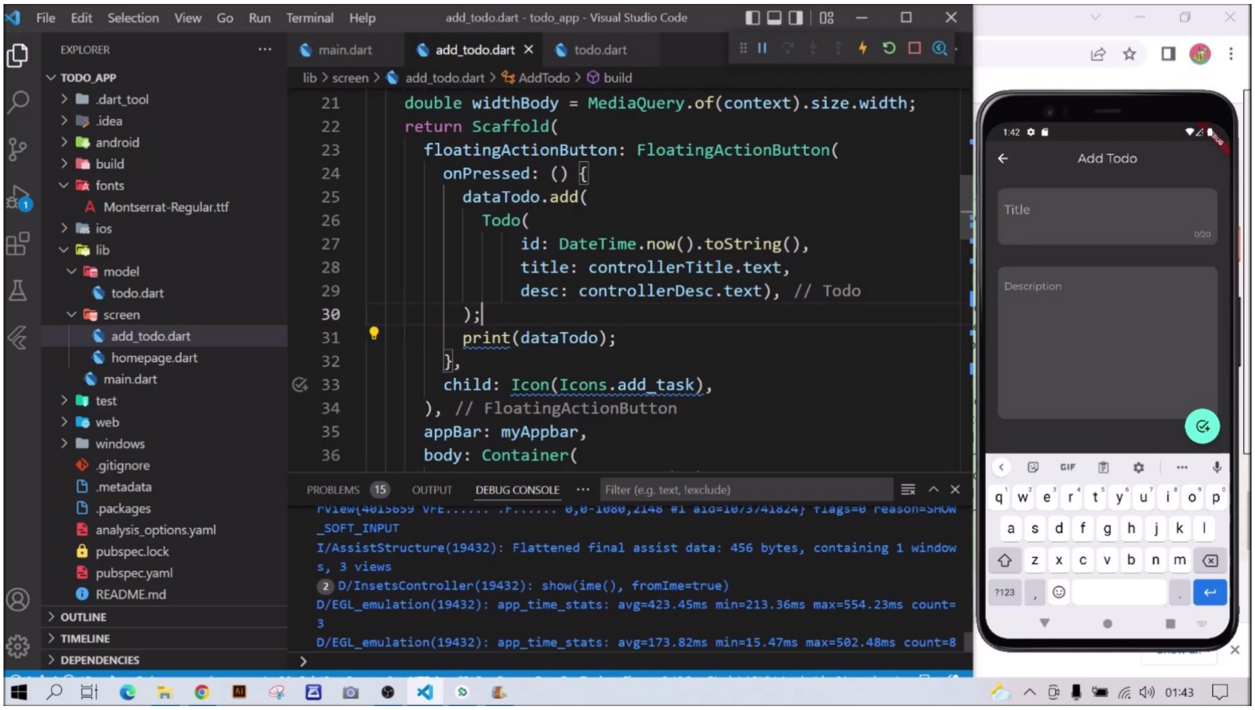
Membutuhkan banyak contructor
Kita kasih id nya sama ini



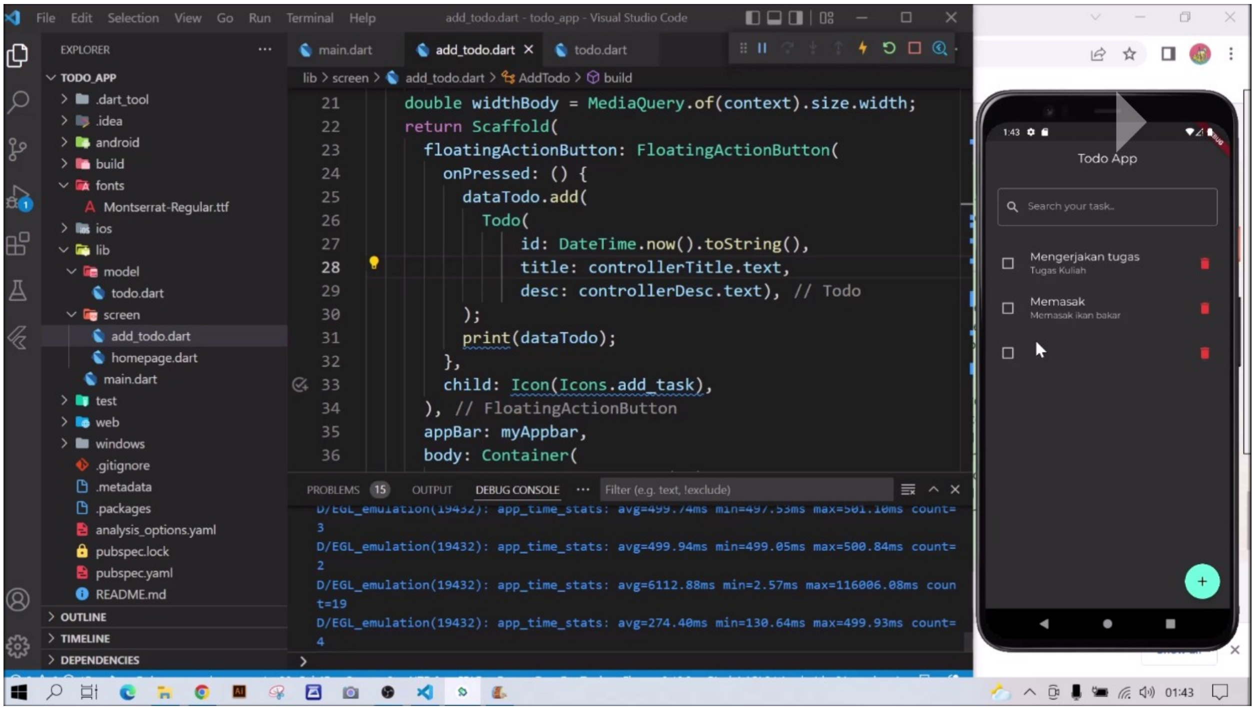
Kemudian title dari controller dan des



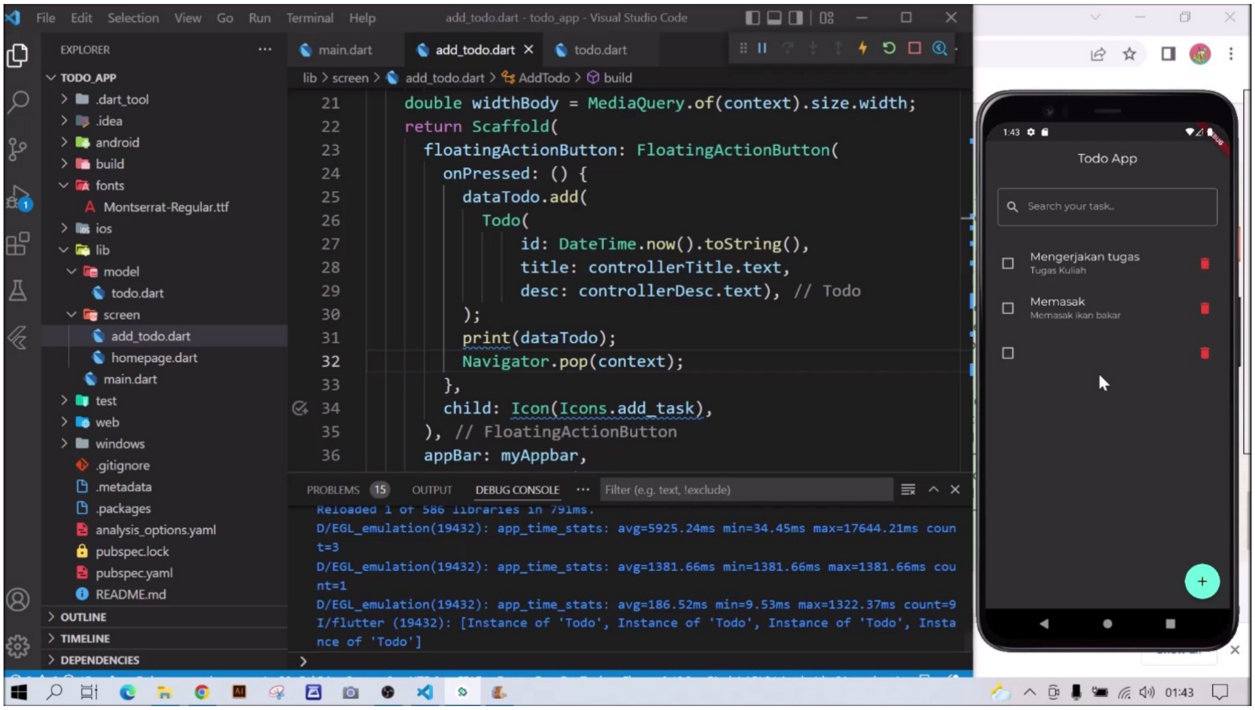
Coba kita pres kita print data todo



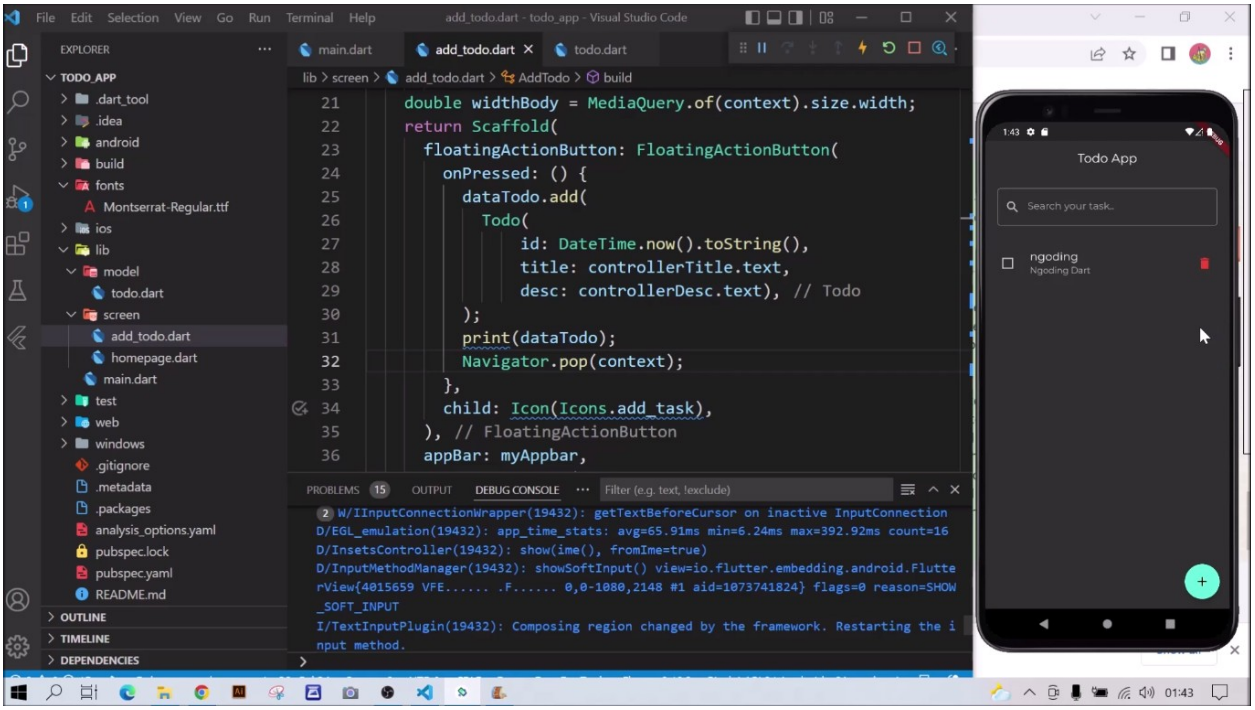
Ketika kembali maka ada 3



Kemudian kita klik maka kembali
Guna navigator

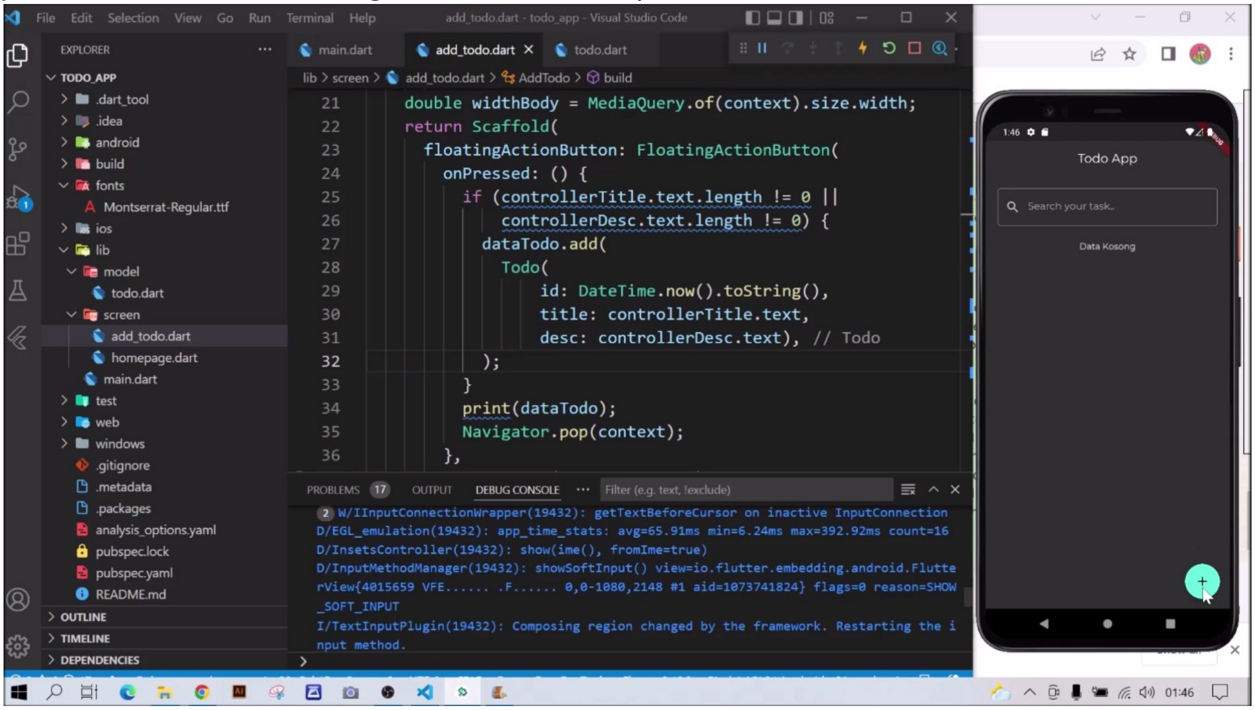


Misalkan kasih data asli

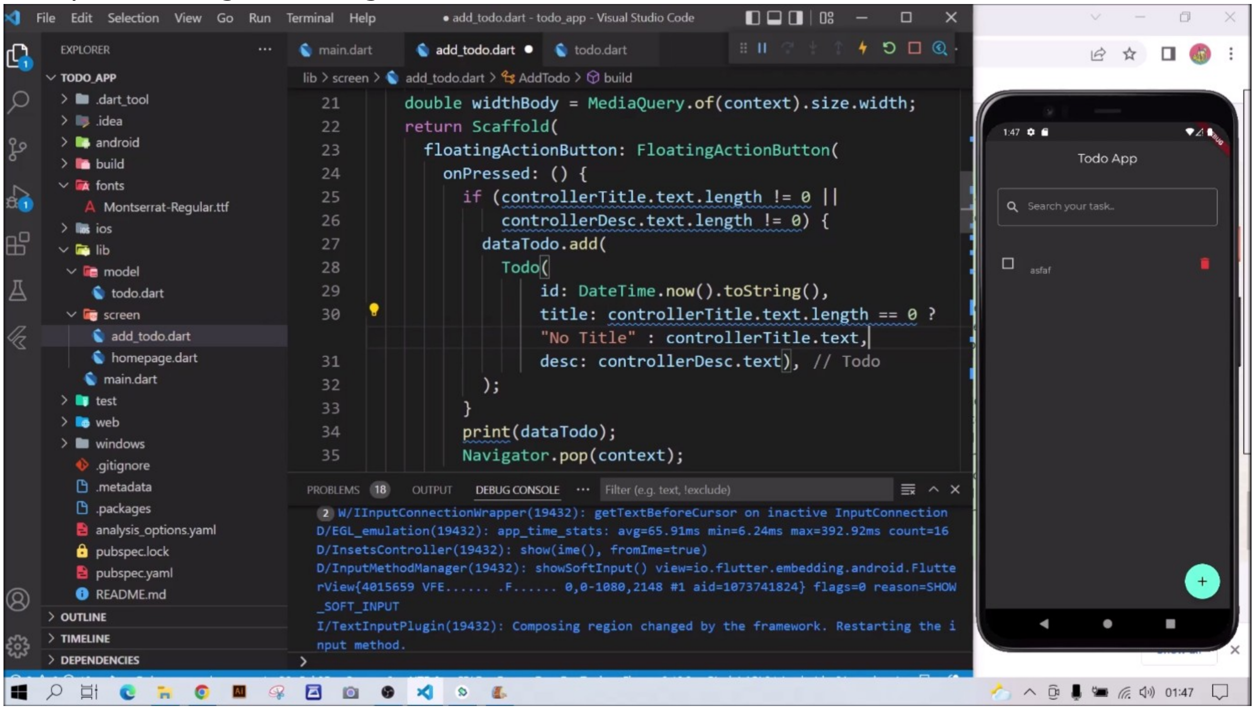


tapi ada kesalahn
Jika dikosongi
Maka tidak ada pemberitahuan data kosong
Jika kosong semua di add tidak timbulo jika dihapus timbul
Untuk perbaikinya kita klarifidasi kan
Jgn langsung add tapi ada persyaratan nya
Jika data kosong data tidak akan di tambah disini kita buat perbandingan

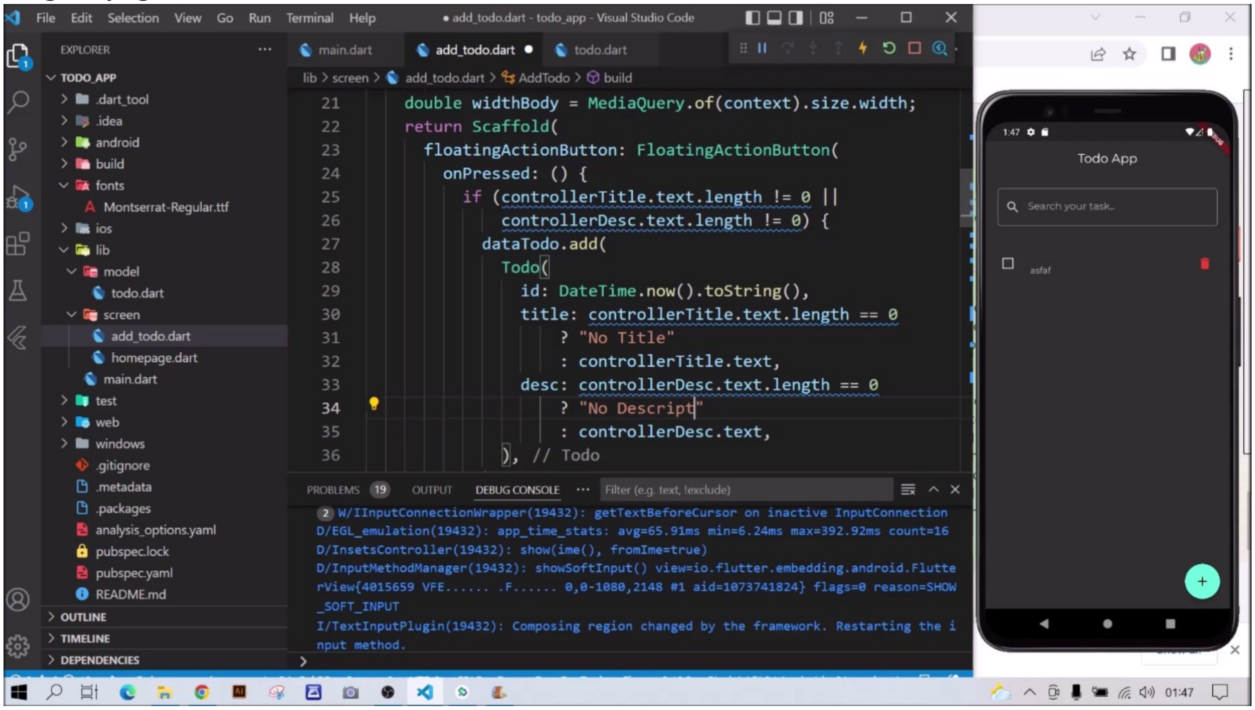
Jika data nya kosong tidak bisa dijalnkan
Artinya jika title dan des maka tidak dijalankan
Jika ada maka dijalankan
Jika kita add kalau kosong maka tidak terinput



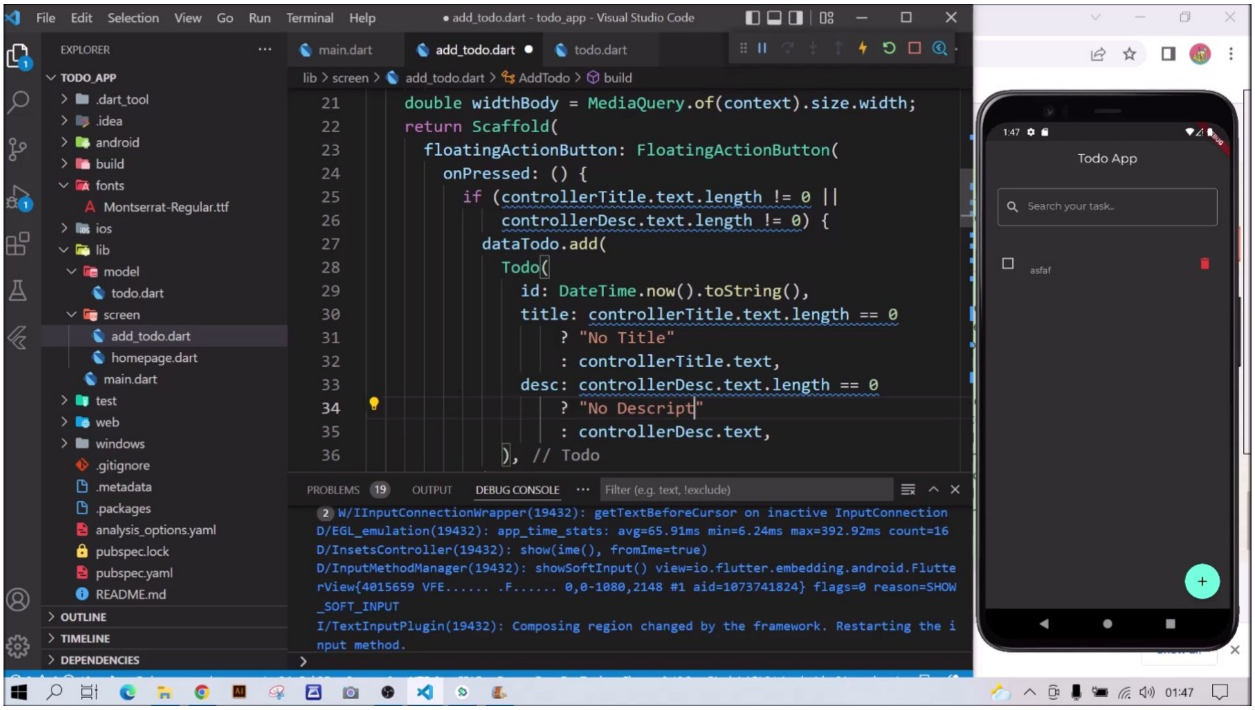
Kemudian tambahkan notitle
Jika tidak disi title maka otomatis ada bacaan notitle
Di add todo
Kita perbandingankan lagi



Begitu juga describsi



Kalau sebaliknya
Maka sudah ada



Disini sudah berjalan degn baik
Disini bisa kalian tambah fitur apa saja sebagai latihan
